

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + Keep it legal Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

TO

The Right Honourable Sir George Grey, Bart., M.P., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

> General Register Office, Somerset House, 15th April 1862.

SIR, I HAVE the honour to submit to you my Annual Report for the vear 1860.

The aggregate number of names enrolled in the Register Books of England and Wales, in that year, was not equal to the number in 1859; but the decrease is not a subject of regret, for it arose chiefly from the fact that the mortality was comparatively low in 1860. The deaths were 18,000 less than they had been in the previous year; the births were nearly 5000 less; but the marriages were more numerous than they had been either then or at any former time.

The men and women married in the year were 340,312; the children born 684,048; the persons of all ages who died 422,721; and together they formed a total of 1,447,081, which, however, does not consist to its full extent of different persons; for it unfortunately happened to a certain proportion of them, that they were implicated in two out of the To many, the first dawn of life abruptly descended into night. To some the year of marriage was the year of death.

The facts to which the present Report relates belong to the year which preceded that of the Census. When the population was enumerated on 8th April 1861, it was found to be 20,066,224; and that its rate of increase in the last decennium had been 12 per cent. Accepting these

1857	19,258,690	159,097	\$18,194	668,071	419,815	945,956
1868	19,471,472	156,070	\$12,140	655,481	449,656	905,825
1859	19,686,895	167,728	\$35,446	689,881	440,781	949,100
1860	19,902,918	170,156	\$40,813	684,048	422,721	961,827

The Population of each of the years since 1831 is deduced from the a

results in conjunction with another fact which the last four censuses have revealed, viz., that the rate of increase has constantly descended during the last forty years, it is estimated that the population of England in the middle of the year 1860 was 19, 902, 918.

It will serve, with a multitude of other facts that are familiar to most readers, to give a vivid impression of the vitality of the English people, to state that when young men who have now barely reached their majority were born the annual marriages were about 120,000, and that

in 1860 they exceeded 170,000.

The marriage-rate was well maintained through the greater part of the year, but especially in the Spring quarter, when Cheshire and Lancashire and generally the manufacturing districts appear to have regarded their position with a cheerful spirit. The average marriage-rate in 23 years was 1.64 per cent. (in other words 164 persons were married to 10,000 living in the population); but the rate in 1860 rose to 1.71. The average birth-rate in the same series of years was 3.311 per cent., whereas the rate in this year was 3.437; a satisfactory result, though not equal to that of 1859. The average death-rate was 2.231 per cent., but 1860 was unusually healthy, and its rate of mortality did not exceed 2.124, which is less than it had been in any of the twenty-two years during which the Registration Act had been in operation, with the exception of 1843, 1845, 1850, and 1856.

The whole year will be distinguished in meteorological annals; but it was the weather of the last six months that appears to have exercised its beneficial influence on the public health, and to have invested the facts with the value of a crucial experiment. At Greenwich the cold weather, which set in towards the end of January, continued with the exception of three weeks in May till the end of June. Wind, with frequent gales of long duration, prevailed during the whole period. The summer (July, August, September) witnessed a continuance of cold weather, which was "bad," in other respects besides cold; there was frequent rain, much cloud, scanty sunshine. But there was little diarrhæa, and the mortality fell remarkably. The last quarter of the year was generally cold; from the

Note.—The Table may be read thus:—In the year 1838 to every 100,000 persons living there were 771 marriages or 1542 persons married, 3029 births, 2238 deaths; the number of persons living to every marriage, person married, birth or death, was 130, 68, 38, and 45 respectively. A correction for increase of population has been made in calculating the above results.

18th December to the 29th the weather was of singular severity, the temperature at Greenwich having fallen in two instances to 7° and 8°. At Nottingham it fell to 8° below zero. There is no instance on record of a mean temperature for the four important months June, July, August, and September, being so low as it was in 1860. The fall of rain at Greenwich in June was 5.8 in. The rain-table does not extend further back than 1815, but in the long period that elapsed since that year there was no example of so great a fall in June. This amount, however, was greatly exceeded in more southern parts, especially Hampshire. The mean temperature of the air was below the average of 19 years in every month, except January, May, and October. The rain collected at Greenwich was 32 in., which is nearly 7 in. more than the average; and it fell on 192 days. The cold checked the development of those seeds of disease with which human beings are surrounded, particularly in towns; the abundant showers and high winds swept them away; and the result was a salubrious summer.

The fall of rain was greatest between latitudes 49° and 51°, near the first of which the amount in the year was 48 in.; next to that region it was greatest between 53° and 56°. The smallest quantity fell at stations

in the intervening space.

The excess of births over deaths was great; it amounted to 261,327. Reckoning from the middle of the previous year to the same period in 1860, the natural increase may be stated at 716 daily, but the actual increase was probably 592. If the latter estimate is correct, it follows that while Irishmen, Scotchmen, colonists, and foreigners poured their tributary rills into the population, the great stream of emigration reduced it below its natural level, and the result was an average daily loss of 124 persons. The Emigration Commissioners account for a considerable part of the efflux, for it appears from their Reports that the number of emigrants of English origin returned to them was about 33,339, or a daily average of 91.

MARRIAGES.

There were 170,156 marriages in the year, of which 137,370 were solemnized according to the rites of the Established Church. It was mentioned above that marriages were more numerous than in the pre-

^{*} Disregarding the decimal point, this will read 804 marriages were celebrated to every 100,000 of the population; 135 were marriages by licence, 669 were marriages by banns. It may be assumed that these two groups represent the whole of the corresponding classes of society, whether belonging to the Church or not.

vious year; and it appears that all denominations, established and non-established, participated more or less in the increase. A very trifling decrease in Jewish marriages, which numbered 312, constituted the only exception. Those in the Superintendent Registrar's office (11,257) also increased; and they formed rather more than a third of the whole number (32,786) not celebrated in the Established Church. Roman Catholic marriages (7,800) formed part of the remainder. Seventy-five were performed at Quakers' meetings.

Of the 137,370 marriages in Church, 108,685 were performed after publication of banns, 20,742 by licence, 4243 upon Superintendent Registrar's certificate, 14 by special licence. But this statement is given as indicating proportions, not as a representation of the exact numbers, for in 3686 cases the clergy omitted to state whether the marriages were by licence or banns. The instances, however, in which this neglect occurs, exhibit a decided annual decrease.

The proportion of marriages by banns to those by licence was 5.24 to one. Wheat was at an average price of 53s. 3d., which may be termed "intermediate." By comparing groups of years, distinguished as dear, cheap, and moderate, it will be seen that those when moderate prices ruled were most favourable in the general opinion of the unmarried for laying the foundation of domestic establishments. The year 1860 helped to confirm that result. If licence and banns be taken as the respective badges of capital and labour, it may be shown that in years of middle and low prices marriage was most frequent in the working classes; in years of high prices it was most frequent in the middle and upper classes; but in the "intermediate" priced year of 1850 the marriage-rate was remarkably well maintained amongst rich and poor alike.

Of the bachelors who married, 139,440 chose spinsters, and of the widowers who married, 8260 selected widows. The bachelors who married widows were not quite so many as the widowers who got widows; but it happened singularly enough, that the widowers who married spinsters were exactly equal to both. In other words, the whole number of widows who renewed the nuptial vow was 15,358; and the number of spinsters who married widowers was 15,358. All these proportions are kept with much uniformity year after year.

[•] The proportion of Widowers and Widows in the Year 1841 is for the September and December quarters only.

Re-marriages.—The number of widowers who entered into wedlock was to that of widows nearly as 8 to 5. Among persons who married, the proportion of those who did not marry for the first time was 11 per cent.

Table VI.—ENGLAND. Marriages.—Proportional Number of Marriages in the several Counties of England during the Year 1860; of Persons who signed their Names; of Persons not of full Age; and of the Re-marriages of Widowers and Widows.

The Table may be read thus by omitting the decimal points:—In England, among every 100,000 persons living 855 marriages took place; of 1,000 men married 745, of 1,000 women 638, signed the marriage register by writing their names; of 10,000 men married 635 were not of full age, of 10,000 women married 1835 were not of full age; of 10,000 men married 1838 were widows.

Minors.—Of persons under 21 years of age who married in the year there were 10,797 males, 32,927 females. The proportion of minors to the total number of those who contracted marriage was 13 per cent. The number of women under age was more than three times as great as that of men.

Signatures of Persons marrying.—43,401 men and 61,677 women signed the marriage registers with marks. The ability to practise the art of penmanship to the extent of writing one's own name, and probably sufficient skill to carry the art beyond that limit, is more common now than it was in 1853, when about 50,000 men and 72,000 women signed with marks. This happened only seven years before 1860, and when those who married were fewer than they were in that year.

It must be gratifying to observe, that education, even though it be no more than the elementary, mechanical part of it, has made steady progress among the people during the last twenty years. The test of the marriage signature is the more unexceptionable, because it is not extracted directly for the purpose of proving proficiency and obtaining a reward, and because it shows that the art had been sufficiently acquired to remain with its possessor for years after school had been left, though it may have been that with hard labour on the farm or in the workshop opportunities were scanty for the practice of it. Nor is the ability to write one's own name contemptible as a measure of education; it is only small when compared with the greatness of human attainments. If a man can write his own name, it may be presumed that he can read it when written by another; still more that he will recognise that and other familiar words when he sees them in print; and it is even probable he will spell his way through a paragraph in a newspaper.

In 1841 and some subsequent years, the proportion of men who signed with marks was 33 to a hundred married. In 1847-52 it was 31; since 1852 it has fallen to 26. Within twenty years the proportion among women has fallen from 49 to 36. The progress in writing is constant; and any slight fluctuations which the tables show would naturally arise in consequence of the annual marriages having been comparatively more or less numerous in rural or town districts, where education is less or more advanced.

Births. ix

showed a remarkably steady increase. The labouring population, when they are comparatively fresh from school, will discover a greater aptitude for writing than when their finger-joints have been stiffened by long and laborious manual operations, a fact which would affect, though to a small

extent only, the educational results as shown in the Tables.

Seasons.—Marriages follow the following order of the seasons by a rule which in England apparently admits of no deviation; they are least frequent in the March, i.e., the first quarter of the year; they are more numerous in the third quarter than in the first; they are still more numerous in the second; and they reach their quarterly maximum in the last quarter. In 1850 the annual rates for the first, third, second, and fourth quarters were nearly the following: to a thousand of the population

7, 8, 9, and 10 marriages.

Registered Buildings.—There were 4403 buildings registered for the solemnization of marriages, and on the register on 31st December 1860. Of these, 132 belonged to Scottish Presbyterians, 1453 to Independents, 976 to Baptists, 10 to Moravians, 540 to Roman Catholics, 152 to Unitarians, 834 to seven different bodies of Wesleyan Methodists, 179 to Calvinistic Methodists, 127 to Swedenborgians, Irvingites, &c. In Wales, where there are 577, the registered buildings are far more numerous than in any other portion of the country with an equal population. The Calvinistic Methodists appear to be the most flourishing body of dissenters in North Wales, for they have there 86 out of 200 registered chapels. They are numerous also in South Wales, where, however, Independents and Baptists much preponderate over any other dissenting community.

The largest number of registered buildings belonging to Scottish Presbyterians is in Northumberland, Durham, and Lancashire. There are in London only 14, which must be considered few in relation to the great number of Scottish families resident in London, and for a people who are well-marked in their national character, and known to be attached to their institutions. Undoubtedly many Scotchmen have connected themselves with the Established Church; and more, perhaps, with communities of English Dissenters. The fact seems to prove that a people may be led, when they cannot be driven, to accept religious ministrations according to forms different from their own; and that the Scotch have found in the greater fluency and directness of English preaching a sufficient compensation for the want of those doctrinal expositions in theology which they

had been accustomed to in their native country.

BIRTHS.

In 1860 the number of male children born was 349,799; of female children born 334,249. The total number of births was 684,048. In the previous year the total number was 689,881. There was a decrease on 1859 amounting to 5833. The birth-rate of the year was 3.437; that of the previous year 3.504. Both were above the average of 10 years, which is 3.417. In Staffordshire and Durham the birth-rate of the year rose above 4 per cent. In those counties it will probably be found that good wages obtainable by young persons create an inducement to the

formation of early marriages.

Sex.—The excess of boys over girls born was 15,550. For each hundred of the latter there were 104.7 of the former. The proportion may be stated as that of 22 and 21. In the South Midland Counties the proportion of male births was generally very high. Thus, in Hertfordshire it was 107 to 100 female births; in Northamptonshire nearly 108; in Oxfordshire 110. But in Cambridgeshire it was less than 103. It was high in Shropshire. In Rutlandshire and Cumberland fewer boys were born than girls, these two counties presenting the only exceptions to the rule, which asserts the preponderance of male births. But the inequalities of one year will be redressed the next, and the relative proportion

of births, as distinguished by sex, will probably be found, in a series of years, to be perhaps nearly the same in a district as it is in England. In Rutlandshire the proportion of boys born to a hundred girls, in 1859, was 111.3; in 1860 it was 00.5.

111'3; in 1860 it was 99'5.

Seasons.—The annual birth-rate fell from 3'7 in the first quarter to 3'2 in the last. It continued to fall through the four seasons; which, however, does not hold as a general rule. The rule is that births are more numerous in the first half of the year than in the second.

more numerous in the miss number of the year shall in the becobe.

In and out of wedlock.—Of children born out of wedlock, 22,159 were boys, 21,534 were girls; the total number was 43,693. Illegitimate children were 6.4 per cent. of the whole number born. In Cumberland, where the proportion rose to its maximum, it was double that amount; viz. 12.1 per cent.; in Norfolk it was 10.7; in Westmorland 10.6; in Shropshire 9.6; in Nottinghamshire 9.1. It was also high in Bedfordshire, Suffolk, Herefordshire, Lincolnshire, and the North Riding of Yorkshire. The proportion of children born out of wedlock in London (4.2 per cent. in the Tables) is very probably understated. There is much greater facility for the suppression of facts in large cities than in

smaller towns and villages. But the proportion was about as low in the extra-metropolitan parts of Surrey and Middlesex; in Huntingdonshire and Monmouthshire.

DEATHS.

There were 422,721 deaths, of which 215,238 were those of males, 207,483 those of females. The rate of mortality was 2·124 per cent., whilst the average annual rate of ten years, 1851-60, was 2·224. In that series of years, 1856, in which the rate fell to 2·051, furnishes the only instance in which the mortality was as low as in 1860. The death-rate in London was 2·249 in 1860; the average was 2·377.

From a comparison of the rates of mortality in different counties, it will appear that the highest degree of health in the year was attained in the extra-metropolitan portion of Surrey, where less than 18 persons in a thousand living died. No other county, each being taken as a whole, presented so favourable a result. In the healthier year of 1856 the same part of England was equally, but not more healthy. In that year the healthiest county in England was Westmorland, where the death-rate fell below 16 to a thousand; but in 1860 Westmorland was not so fortunate as many other counties, for in it the rate was nearly 20, though the average does not much exceed 18. It was in the Spring (or second) quarter that the health of that northern county was in an unfavourable state.

Seasons.—The rate of mortality in 1860 was comparatively low, but the fact was due to the unusual salubrity of the summer, or third quarter. The rate fell in that season to 1.718 per cent. for England, which is lower than that of any of the twenty-two preceding summers. The healthy year of 1856 had not a very healthy summer, for the death-rate was then nearly 1.9, the average being about 2.

The meteorology of the summer of 1860 has been already described in general terms. Many details connected with the public health in the different seasons of that year, as it appeared to be affected by temperature, rain, sanitary condition, &c., will be found in the following summary of the Quarterly Returns.

SUMMARY OF THE QUARTERLY REPORTS, 1860.

First Quarter-January, February, March, 1860.

The first quarterly return of the year 1860 presents nearly average results. The marriages were not quite so numerous as they were in the same quarter of 1859, but exceeded those of any corresponding period in the 11 years 1848-58; the marriage-rate, namely, the proportion of

The Table may be read thus:—In the year 1888 to every 100 males living there were 2.885 deaths of males; to every 100 females living there were 2.185 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the relative mortality of males and females; and that out of equal summers living the deaths of males were 109 to every 100 deaths of females in 1888.

Digitized by Google

persons married to the then existing population, was also slightly above the average for the quarter. The birth-rate was above the average of the ten preceding winter quarters. The death-rate was slightly above the winter average, but below the rates of the two previous winters. The weather in the beginning of January was warm, but remained so cold and ungenial afterwards as to retard vegetation and to swell the return of deaths. The prosperity of trade and the sanitary improvements of towns produced a countervailing effect.

Marriages.—In the first three months of 1860 the total number of men and women who married was 70,300, being a great decrease on the 100,992 married in the preceding Christmas quarter. The difference, it may be re-assuring to know, is not the result of sudden depression in trade or other calamity, but of laws of habit and convenience, by virtue of which the closing months of the year are most, and the opening months least, preferred for the accomplishment of nuptial vows. The annual marriagerate for January, February, and March was 1.422 per cent., whilst the average rate for the same period is 1.416.

The Table may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 3,032 births, and 2,615 deaths registered. The three months January, February, March, contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the

Digitized by Google

The marriage-rate for the quarter was as high as 1.556 in 1853, and

as low as 1.252 in 1858.

Births.—The births of 183,180 children were registered in the quarter that ended on March 31st; or 7648 in excess of the numbers registered in the corresponding quarter of the previous year. The birth-rate of the

quarter was 3.707; or 0.152 in excess of the average rate.

Increase of Population.—The births registered in the 91 days of the quarter exceeded the deaths by 60,563. So the natural recorded increase of the population of England and Wales was at the rate of 666 daily; the probable increase of the population of the United Kingdom was at the rate of 999 daily. 20,784 emigrants, including 917 foreigners, sailed from the ports of the United Kingdom during the quarter; 5954 were of English origin, and went to the United States and the Australian Colonies in nearly equal numbers; only 9 went in this cold season direct to the North American colonies.

Prices, the Weather, and Pauperism.—The births, deaths, and marriages of the population are influenced by the weather, the prices of food, and

the activity of trade.

The average price of wheat was 44s. 5d. a quarter, while in the corresponding quarters of the two previous years it was respectively 46s. 5d. and 40s. 8d. There has been little fluctuation in the price. Beef was sold on an average at $5\frac{1}{8}d$. a pound by the carcase at Leadenhall and Newgate Markets; the average of the highest prices of the best beef having been $6\frac{1}{2}d$., of the lowest prices $3\frac{3}{2}d$. The price of the inferior beef was 1d. a pound lower than it was in the winter of the preceding year; so the price fell 21 per cent. The superior beef only fell from 63d. to 61d. The average price of mutton was 53d. a pound; the price of inferior mutton was 4\frac{3}{4}d., the superior mutton was 6\frac{3}{4}d. a pound. The price of the inferior mutton was the same as it was last year; the price of the best mutton was a farthing lower. The York Regent potatoes sold on an average at 130s. a ton at the waterside market, Southwark; so the price though lower than it was in the winter quarter of 1858 was 44 per cent. higher than the average price (90s.) of last year.

The mean temperature of the three months was 38.8°; February, being the coldest month, 35.7°; and March, 41.1°, little warmer on the average than January, 30.7°. The characteristics of the season were: warmth on New Year's Day (16° above the average temperature), and in the following days until January 25th, when cold weather set in and continued to the end of the quarter; the frequent and great changes of the atmospheric pressure; and an almost continuous succession of gales of

wind.

Mr. Glaisher has described the meteorology of the quarter in detail.

Pauperism is declining.

State of the Public Health .- 122,617 deaths were registered in the winter quarter. The rate of mortality for the quarter was 2.481 per cent., or slightly above the average of the season (2.460); which in the absence of epidemics is always the most fatal in England.

The rate of mortality in the chief town districts was 2.636; in the small town and country districts 2.338 per cent. The latter rate is above,

the former below, the average of those districts respectively.

The deaths in the quarter, at the rates actually prevailing in the healthier districts of the country, would have amounted to 88,372; the actual deaths amounted to 122,617. Consequently the deaths from causes induced by the unfavourable sanitary condition in which large numbers of the people live amount to 34,245.

The mortality of London was above the average; it is described in the

Weekly Tables.

9985 persons died in the SOUTH-EASTERN COUNTIES; in Surrey out of London the quarterly mortality was above the average of the two preceding years; in Kent and Sussex below the average. In Portsmouth the births and deaths were increased by the accessions to Her Majesty's dockyards.

Digitized by Google

The population of Southampton is in a comparatively healthy state. Small-pox was prevalent in the Abingdon district; the Registrar printed notices at his own expense, and affixed them on the church doors. Some parents were stubborn, others were negligent; and their children con-

sequently suffered or died of small-pox.

The deaths in the SOUTH-MIDLAND DIVISION were below the average. 17 cases of fever occurred in Sunbury, Staines; and apparently owed their origin to bad sanitary arrangements. 71 deaths happened in the Colney Hatch Lunatic Asylum. The enforcement of sanitary regulations is imperatively needed in the Toddington sub-district, where 44 deaths were registered. In Caxton 4 deaths from diphtheria, 3 in one family, were recorded. About the fens of Cambridge ague and typhoid fever prevailed.

10,064 children were born and 2972 persons married in the EASTERN COUNTIES; 6579 deaths were registered, and the mortality was much lower than it was in the winter of 1858, but higher than it was in the preceding winter. The births in Colchester, which is a garrison town, are unusually numerous; the deaths are below the average, but influenza and whooping-cough have prevailed. The cold winds have undoubtedly been severely felt in Norfolk and Suffolk; but the considerable amount of sickness has not greatly raised the mortality. In Stalham and Fincham, however, the deaths exceeded the births; 16 persons died of

diphtheria in Stalham, 8 in Fincham.

10,850 persons died in the South-Western Counties; where 15,904 children were born and 6430 persons married. The mortality rate was lower than in the two previous years. Poole in Dorsetshire has been in an unhealthy state; influenza apparently prevailed there with some intensity, and proved fatal to children and old people. The deaths (83) nearly equalled the births (88); the deaths in the whole district were 109. Small-pox and measles prevailed in South Devon. In Exmouth the Registrar says:-"The deaths are one fourth above the average. " 12 were from small-pox; but only one after vaccination, and in this " case the variolous eruption appeared seven days after the operation. " Vaccination has been attended with the most beneficial effects, and has " arrested the progress of the disease. I believe there is scarcely a case " remaining in this district." Vaccination in this case was performed while the small-pox matter was developing itself in the system; hence it was not a case of small-pox after protection by vaccination had been effected. Such cases are ignorantly cited as instances of small-pox after Vaccination is much neglected and small-pox has been fatal vaccination. Small-pox, whooping-cough, and measles have raised the deaths in Bideford (16) above the average. A great number of illegitimate children are sometimes born in a small sub-district at the same time; thus, in Lyme 6 of 27 children were born out of wedlock in the last quarter.

Disease is propagated in parts of Cornwall by defective sanitary arrangements. Thus diphtheria has been fatal in Kea. The Registrar of Callington makes the following observation:—"This district is at this "time rather unhealthy. During the quarter I have registered 8 deaths "from typhus (probably typhia), 2 of which, those of mother and child, "were in one house, and now the father and three other children are "ill. The medical officer in his report to the board of guardians, dated "28th March, says that "these children absolutely require removal from "the wretched hot-bed of fever in which they now lie; they require "careful and constant nursing, cleanliness, ventilation, beef-tea ad "libitum, port wine, and various other articles." Again at Camborne 6 deaths occurred from scarlatina, 2 from diphtheria, 8 from fever; the latter occurring in parts of the town where drainage and sewerage are much neglected.

In the West Midland Counties the marriages and births were above, the deaths below, the average numbers. 8026 persons married; 23,833

children were born; 14,909 persons died. The health of the large towns of this division is evidently improving; the fatality of disease is less than it was in Bristol and Clifton, where the deaths during the three last winters were 1194, 979, 876; in Birmingham and Aston 2046, 1923, 1740. If the municipal authorities succeed in supplying all the towns with pure water, and removing all the disinfected nightsoil and refuse to the fields, they will witness still further diminutions in the heavy death-rate which is now levied on the inhabitants.

South Staffordshire contains a great number of enterprising men who are doing much valuable work; they extract coal or iron, and manufacture hardware; but their attention has not hitherto been seriously directed to the preservation of the health of the people, who suffer from all kinds of pestilential diseases, and are in a deplorable sanitary state. In the district of Wolverhampton alone, for example, 980 deaths occurred in 91 days; the mortality was high before, and while Birmingham is getting better, the health of the district of Wolverhampton is every year getting worse. Several hundreds of the inhabitants are every year disabled by sickness; funerals are a staple trade; parents lose their children, wives their husbands, and children their fathers, by the poison of the place; workmen and people in trade are cut down at all ages in alarming numbers. Mechanism and chemical knowledge and capital abound in the Wolverhampton district; why should they not be applied to render the sanitary arrangements perfect? The deaths are below the average in Wednesbury, and this the Registrar attributes to improvements which the Local Board of Health has effected in "supplying the town with pure water, attending " to the sewerage, and compelling people, as far as possible, to cultivate " habits of cleanliness." This is satisfactory.

The marriages and births increased, the deaths decreased in the NORTH MIDLAND COUNTIES, where 3942 persons married, 11,875 children were born, and 7540 deaths were registered. Fever and diphtheria have proved fatal in some districts. Thus typhus prevailed in three villages of Oakham; it was apparently the result of overcrowded sleeping rooms and want of ventilation. Diphtheria, scarlatina, and typhus, were fatal in several villages of Spilsby; diphtheria killed 13 young persons under 26 years of age in North Kelsey. The Registrar of East Retford comments justly on the severity of the weather, to which he ascribes "the " fearful mortality" throughout the whole of his district. The Registrar of St. Ann, Nottingham, on the other hand, records 224 births and only 127 deaths. "The deaths," he says, "are below the average of corre-" sponding quarters;" adding, "the sanitary arrangements are excellent " and carefully carried out, to which cause, no doubt, the decrease in the " mortality may in some measure be attributed." It is evident that the severity of the season must have been felt all over the kingdom; yet notwithstanding the effects of the weather, the mortality decreased wherever sanitary arrangements were sedulously worked. Even careful observers, sometimes, it may be remarked, refer the excessive mortality of their districts to the weather, or to some other causes over which people have little or no control. They do not bear in mind that foul air is more fatal than cold air, and that food and clothing and active employment keep out the cold.

The marriages as well as births increased, the rate of mortality decreased in Lancashire and Yorkshire. 11,048 persons married, 23,195 births, and 16,024 deaths, were registered in Lancashire; 8034 persons married, 19,148 births, and 12,610 deaths, were registered in Yorkshire. The mortality fell in Liverpool and Manchester. The decrease of the mortality is ascribed to the rise of wages, the active employment of the people in the factories, and to the sanitary improvements, which are so imperatively required in these two great counties.

In the Northern Counties 4114 persons married; 10,879 births, and 6683 deaths were registered. The deaths are rather more numerous than

they were last year; but the mortality is lower. Small-pox, diphtheria, scarlatina, and fever prevailed in some districts, especially those which are left in a dirty state.

In Monmouthshire and Wales 4366 persons married; 11,776 births, and 8190 deaths, were registered. The mortality was below the average

of Wales.

Second Quarter-April, May, June, 1860.

The leading facts in the Return may be stated thus:—the marriages were increasing; the births were fewer than in the same quarter of 1850. and were also fewer than they would have been if the average spring birth rate had been maintained; the deaths exhibit in no faint characters the effects of an ungenial season, and the rate of mortality was higher, with only two exceptions, than in any corresponding quarter of the previous ten years. The general aspect of the Return is not satisfactory.

Marriages.—87,554 persons married in the quarter; and the rate of marriage was 1.766, exceeding the average by .051. The marriages rose from 39,890 in the spring quarter of 1858 to 43,777 in the corresponding quarter of the present year. From this fact it may be inferred that the prospects of the working classes have been growing brighter, and that their real condition has improved. The increase of marriages has been greatest in Cheshire and Lancashire, in London, and generally in the manufacturing districts; but an increase is observable in every division except the Eastern Counties.

Births.—The number of boys and girls born in the quarter was 174,028, the number in the previous quarter that ended March 31st having been 183,180. On an average of years as many children are born in the spring quarter as in the winter, but in the present year there was,

as these figures show, a decrease that is not unimportant.

The births in the quarter were to the population in the annual proportion of 3.512 per cent., whilst the average rate is 3.559. It may be added, that the birth-rate was lower than in any spring quarter of the previous ten years, except those of 1852, 1853, and 1858, and in each of those periods the mortality was above the average, as was also the mortality of the antecedent winter quarters.

Increase of Population.—In the 91 days of the quarter the births exceeded the deaths by 63,159. This excess represents the natural increase of the population in that period; the increase, aided by ingress from Scotland, Ireland, and more distant parts, is more considerable.

The emigration of the last quarter consisted of 48,626 persons, who sailed from ports in the United Kingdom at which there are Government emigration officers. By distributing 8260, who are not distinguished as regards the country of their birth, proportionally over the rest who are thus distinguished, it appears that 9437 were English, 3461 Scotch, 33,438 Irish, and 2290 were foreigners. The United States were the destination of three fourths of the whole number. Of the English emigrants 5945 chose the United States, 2792 the Australian Colonies. Although in the emigration to America the Irish were five times as numerous as the English, a considerably less number of the former, as compared with the latter went to Australia; whilst as regards persons of Scotch origin, it is remarkable that nearly as many went to the North American Colonies as to the United States, and more than twice as many went to Australia as to either of those parts of America. character is in part the cause of these differences; but they are chiefly to be referred to the better or worse condition in life of the emigrants.

Prices, the Weather, and Pauperism.—Wheat has risen in price; the average in the three months ending June 30th, was 52s. 8d. per quarter. In the same period of last year it was 47s. 3d., and in that of 1858 it was 44s. 1d. The dearness both of bread and meat has been sensibly felt by the labouring class. The average price of beef was $5\frac{3}{4}d$, per lb., that of mutton $6\frac{1}{2}d$. as sold in the carcase at Leadenhall and Newgate Markets. Taking for review the nine quarterly periods that have passed since March 1858, beef has lately risen above previous prices, that of the early part of last year being excepted; and mutton has ranged still higher. The average price of superior mutton was last quarter $7\frac{1}{2}d$, higher by three farthings than in the previous nine months; that of superior beef was $6\frac{3}{4}d$., and showed a less increase. Inferior beef was a penny dearer than it had been in the beginning of the year. The prices of both qualities of beef and mutton were higher than in the June quarters of 1858-9, except that of inferior beef $(4\frac{3}{4}d)$, which was the same as respects the two June quarters of 1859-60. York Regent potatoes sold at the waterside market, Southwark, at an average price of 142s. 6d. per ton: they were not so dear as in the same quarter of 1858 (162s. 6d.), but much dearer than in that of last year (97s. 6d.)

The numbers of paupers, both in-door and out-door, were less last quarter than they were in the same period of 1859; but the decrease was inconsiderable. A decrease more important is observed when they

are compared with those of 1858.

The temperature of the air, barometrical pressure, rain and other elements of the weather, which has been of unusual character, are minutely and skilfully described by Mr. Glaisher. He states that both days and nights in April were remarkably cold; those in May were both somewhat warmer than usual; in June both were cold, particularly the high day-temperatures, which were lower than in May though usually they are higher by seven degrees. April was colder than it had been previously in any year since 1839; and we must travel back to 1821 to find so cold a June. June was colder than May at Guernsey, in Cornwall and Devonshire, and near the sea, south of latitude 53°. The mean temperature of the quarter at Greenwich was 50.5°, which is less by 2.3° than the average of the same quarter in 19 years. At Greenwich the rain-fall in June was 5.8 in.; as far back as 1815 there is no instance of so large a fall in June. This fall was, however, greatly exceeded at stations south of Greenwich, particularly in Hampshire.

State of the Public Health.—The deaths registered in the three months that ended June 30th were 110,869; a larger number than was returned in any previous June quarter (1848-59). The extent to which life was invaded and destroyed by causes that have been described, badness of weather and dearness of food, can be only partially discovered by comparing the mortality with an average derived from seasons both healthy and unhealthy; but it may be stated that the annual rate of mortality last quarter was 2.237 per cent. of the population, while the average of ten previous springs was 2:195. In other words the mortality was such that if it had been maintained for a year, out of a hundred thousand persons 42 would have died in excess of the number to whom a season that could not be represented as healthy, but only of

average character, would have been fatal.

If the mortality had been at the rate of 17 in a thousand annually, which is ascertained to be the rule of selected healthy districts, instead of the actual rate (22), the deaths in the whole of England and Wales last quarter would have been 84,927; and 25,942 persons would, when the period had closed, still have formed as many units in the sum of human existence. An excess of deaths which is not decreed by inexorable fate may very properly be termed "unnatural," though it is quite true that, only the conditions being different, it is nature that killeth as well as giveth life.

It is a remarkable and interesting fact that if two millions of acres on which the chief towns of England are situated, be distinguished from the remaining thirty-five that hold small towns and country parishes, it is found that the rate of mortality on the former (2.328 per cent. per

annum) was below the average of last quarter, whereas on the latter the rate, 2'154, was above the average. The average rates were respectively 2.373 and 2.041. Although the time may be distant when cities will be as healthful as rural districts, or the inferiority which our English poet ascribed to "the town" as the handiwork of man become much less apparent in point of salubrity than it is at present, it cannot be questioned that large populations have even now advantages of a nature favourable to health which villages do not possess. The highest attainable health is probably to be sought in a happy combination of both states—rus in urbe. The words of an excellent popular writer may prove to be no dream, but a well-founded expectation; he believes that we shall ultimately obtain "a complete interpenetration of city and country, a complete fusion of "their different modes of life, and a combination of the advantages of both, "such as no country in the world has ever seen." But it may be asked, whether it is forbidden by this last expression to accept as a perfect model even Nebuchadnezzar's Babylon, which the distinguished writer himself has extolled.

In London 14,932 persons died in the quarter. The metropolis lost about a thousand more lives than in the healthier spring of 1859. Pulmonary complaints were very fatal. The mortality from zymotic diseases generally was comparatively low; in this class measles chiefly prevailed.

The SOUTH-EASTERN Counties returned 9214 deaths, against 8830 and 8468 in the springs of 1858-59. The parish of Barming in the Maidstone district suffered from angina maligna; Worth in Sussex from diphtheria, which also attacked Newport in the Isle of Wight. Scarlatina was fatal in Southampton; and the Registrar of Landport, Portsea Island, states that the "long winter and cold spring" had produced a high mortality in his district.

In the SOUTH MIDLAND COUNTIES the mortality was high, except in Huntingdonshire. Typhus was imported from Luton into Wheathampstead (St. Albans) and six deaths from it occurred within a distance of 100 yards. Cesspools and pigsties, till then undisturbed, were at length abolished to stay the infection. Northampton suffered severely from small-pox, which was fatal in 34 cases in St. Giles, and in 25 in All Saints. Ague was

very prevalent at Sutton in Cambridgeshire.

The Eastern Counties show an increase in the deaths, which number 6226. The medical attendant of a lady who died at Colchester from erysipelas considers that bad sewerage was the cause of the death: "The public sewers in the neighbourhood were so defective in trapping, "that the house [where she lived] was poisoned with the stench." The Registrar of Radwinter mentions that the parish of Hempstead has generally more deaths from fever than all the rest of his district; and he complains of the indecent overcrowding of cottages. It is stated that ague has probably never been so prevalent at Wenhaston (Blything) as in last quarter; it was caused by the miasma from saturated marsh lands near the sea. Able-bodied men were the class most subject to it. In Norfolk diphtheria has prevailed at Holt, South Walsham, and Wells; small-pox at King's Lynn, where it has been fatal to the unvaccinated.

The deaths rose above 10,000 in the SOUTH-WESTERN COUNTIES; they were nearly 900 more than in two corresponding quarters. They were numerous in Wiltshire, Devonshire, and Cornwall. In Chippenham, where measles has been very prevalent, the total deaths rose from about 100 to 133. The same complaint was fatal at Lympston and Bideford in Devonshire, also at Saltash in Cornwall; and its fatality was believed to be owing to the cold wet season. Scarlatina was prevalent and fatal in Corfe Castle sub-district, and Camborne. "The unusual severity of the "weather" caused 25 deaths by whooping-cough, out of 82, at St. Agnes,

Truro. Plymouth suffered much from small-pox.

^{*} Charles Kingsley's Miscellanies: Great Cities.

The West Midland Counties appear to have been on the whole healthy, but the mortality was high in certain localities. In Gloucester district, where the total deaths rose from about 165 to 253, measles was very fatal; it also "prevailed to an alarming extent" at Newhall (Burton-upon-Trent), where the want of sanitary arrangements is reported as the chief cause of increased mortality in the parish. Scarlatina attacked Whitchurch and Market Drayton in Shropshire, and was fatal in many cases. Four children died from diphtheria at Yarkhill in Herefordshire.

The North Midland Counties were not unhealthy, except Lincolnshire, in many parts of which measles prevailed fatally; and at Gedney Hill there was ague. Hayfield in Derbyshire returned 12 deaths from The returns from Cheshire and Lancashire (NORTH WESTERN) were not in the aggregate heavy; but measles, so common in other parts, visited Heaton Norris, Macclesfield, Liverpool, West Derby, Manchester, Salford, and Preston; 17 deaths from small-pox at West Leigh. The mortality rose a little in Yorkshire. Ripponden (Halifax) suffered greatly from scarlatina. Many children died from measles in Leeds. Diphtheria caused numerous deaths at Campsall, Aberford, Richmond, and in the ill-drained village of Borrowby at Northallerton. Bad drainage and impure water caused an outbreak of typhus in East Cowton (Northallerton). Mention has been made by the Registrar more than once of the bad sewerage at Sherburn, a few miles from Scarborough. In the NORTHERN COUNTIES at Little Chilton (Stockton) marshy ground bred much ague of a virulent character. Southwick village (Sunderland) is described as in "most dreadful" sanitary condition. In Wales, out of 46 deaths in Kenarth, 14 were from diphtheria, which was also very fatal at Llanarmon.

Third Quarter.—July, August, September, 1860.

The temperature during the quarter was unusually low, the sky cloudy, the earth often sunless, and the weather generally bad, in the language of meteorology; nevertheless, the progress of the phenomena which the returns record is satisfactory. The mortality was much below the average, the births little differed from it; the marriages became more frequent. Sanitary improvements have gone on, and the general result of the wet weather has been a better supply of water, the purification of the sewers, and the retardation of putrefaction, as well as of the zymotic changes which produce diarrhæa. Fruit has been comparatively abundant, and its consumption has also had a salutary effect. Mr. Leigh, of Manchester, justly says, "the dependence of diarrhæa upon a high temperature "seems to be most marked, for fruit has been unusually plentiful, and it "has been eaten most freely without ill effect."

The ultimate results of the extraordinary season will be watched with interest as they are revealed in future returns.

Marriages.—81,082 persons married in the quarter; and the marriagerate was 1.614, or higher than in any corresponding quarter since 1856, but slightly below the average of ten summer quarters.

The increase of marriages was most striking in London and in Lancashire.

Births.—164,121 children were born and registered in the ninety-two days of July, August, and September. The number is less than the number in the last year, but exceeds largely the numbers registered in the corresponding summer quarters of any previous year. The increase of births is most considerable in London, Lancashire, Cheshire, and Yorkshire. The birth-rate of the quarter was 3.267; the average of the season being 3.280.

season being 3.280.

Increase of Population.—The excess of births over the deaths in the quarter was 77,809; so the natural increase of the population of England

and Wales was at the rate of 846 daily; and if the rest of the population increased equally fast the natural increase of the United Kingdom must have been at the rate of 1266 daily. The increase exceeds any on record.

About 10,874 emigrants of English origin sailed from the ports of the United Kingdom at which there are Government emigration agents; 5134 to the United States, 336 to the North American colonies, 4115 to the Australian colonies, and 1289 to other parts. 33,734 emigrants sailed from these ports, of whom about 1433 were of foreign origin. Half of the Scotch and only about one eighth of the Irish go to the Australian colonies.

Prices, the Weather, and Pauperism.—The prices of provisions have been high during the thirteen weeks. Taking the corresponding weeks of 1859 as the starting point, the price of wheat rose 34 per cent., beef 7 per cent., mutton 11 per cent., potatoes 59 per cent. The average prices during the thirteen weeks were: wheat 59s. 1d. a quarter, beef $5\frac{\pi}{5}d$., mutton $6\frac{3}{8}d$. a pound by the carcase in the Leadenhall and Newgate markets; York Regent potatoes 135s. a ton at Waterside Market, Southwark. The prices of the lower qualities of beef were stationary $(4\frac{1}{4}d)$, and the prices of the higher qualities rose from $6\frac{1}{4}d$. to 7d. a pound. The prices of the lower and higher qualities of mutton rose $\frac{1}{4}d$ and $\frac{3}{4}d$ in the pound in the twelvemonth, and were respectively $5\frac{1}{4}d$ and $7\frac{1}{6}d$. a pound during the thirteen weeks.

The mean temperature of the thirteen weeks at Greenwich was 56° 2; which is less by 3° 3 than the mean temperature of the corresponding seasons of 80 preceding years. The temperatures of July, August, and September were all below the average to nearly an equal extent. There is no other instance on record of so low a mean temperature of the four months June, July, August, and September as 55°.9. By going back to 1771 Mr. Glaisher, however, finds a mean temperature of 56°.0. The fall of rain in the three months was 9.6 inches, which is 2'r inches in excess of the average. The fall of rain has been 25.1 inches at Greenwich during 9 months, and has varied at the several stations from 16.8 inches at Scarborough to 42.6 inches at Lampeter in Cardiganshire. The excess of rain at Greenwich in the nine months is 6'o inches. Upon this subject and others Mr. Glaisher in his valuable report gives some interesting details; and among them may be mentioned the time at which the crops as well as some fruits ripened. According to his reports the potato disease is not so bad in the south as it is in the north of England.

Pauperism is declining; on an average 769,360 were in the receipt of relief, while the number in the corresponding weeks of the previous year was 783,449.

State of the Public Health.—86,312 deaths were registered in the three months ending in September, or less by 17,904 than the deaths (104,216) registered in the corresponding quarter of 1859. To every six deaths in the last there were only five in the present summer. The rate of mortality was 17; whereas the average of the season is 20 per 1000.

The reduction of the mortality is observable in the town and in the country districts; but it is by far the greatest in the town districts. The rate of mortality in the town districts fell from 23.77, which is the average of 10 summer quarters 1850-59, to 18.61 per 1000; in the country and small town districts from 17.51 to 15.84, or 5.16 degrees in the town and 1.67 in the country districts.

This is exceedingly gratifying; and if the supply of vegetables prove adequate through the year, it is not probable that the reaction will deprive the population of all its gains. The drainage of the banks of the Thames and of the other marshy districts of the country would secure the inhabitants from the attacks of neuralgia, rheumatism, ague, and fever which often follow rainy seasons.

In London the mortality was low; the prevailing diseases have been

described in the Quarterly Summary of the Weekly Tables.

The South Eastern Division has been healthy; the deaths much below the average in every county. 3 deaths from diphtheria were registered at Leatherhead, and Woking is said to have suffered exceptionally, but in Chobham, Ripley, and Kingston the deaths were much below the average. The deaths in St. Peter's, Brighton, were below the average, and the district has been unusually healthy. The sewers have been well flushed and cleansed by the constant rains. In Kent nearly every district was healthy; but in Ashford scarlatina prevailed; in Barham diphtheria. Portsmouth, generally an unhealthy place, has suffered less than usual; 400 persons died in the district. In Southampton the mortality has been low; none of the epidemic diarrhœa has appeared in Winchester.

5358 deaths were registered in the SOUTH MIDLAND COUNTIES, and in every county the mortality was below the average. In the parish of Knebworth, Hertfordshire, with a population of 200, however, 12 children died of diphtheria, and several are suffering from it now. Small-pox is still epidemic in Northamptonshire; Daventry and Peterborough are especially mentioned. Small-pox is also very prevalent in Newmarket.

The Eastern Counties have been healthy; the deaths, which were 6158 in the previous summer quarter, amounted only to 4563. Diphtheria caused 7 deaths in the South Walsham sub-district of Blofield, but is mentioned in no other district of Norfolk, Essex, or Suffolk. In Watton, Wayland, two families were attacked by typhoid fever, brought, the registrar asserts, from London; otherwise the district was healthy. The sanitary arrangements have been a great benefit to this district. Colchester is now healthy; and there has been no death from diarrhees.

The South-Western Counties out of a population of nearly two millions lost 7050 by death; whereas the deaths in the previous summer quarter were 8515. Every county, Wilts, Dorset, Devon, Cornwall, Somerset, alike enjoyed this immunity. Out of a population of about six thousand in Wilton only one death occurred in thirty-two days. Small-pox has attacked several children in Summercourt, Newlyn, where vaccination has been very generally neglected. In Clutton, Somersetshire, the reduced mortality is referred to improved sanitary arrangements, better dwellings, more provident habits, and fuller employment in the coal mines and husbandry than is generally obtained in the neighbourhood. The deaths in Bath have fallen in three successive summer quarters from 406 to 370, and 286. In the Bridport district the deaths (75) were more numerous than they were in the previous summer (59); and as is evident from a local inquiry, the mortality of the town is so high as to admit of great reduction by sanitary arrangements; which the enlightened part of the inhabitants appear to be disposed to adopt.

The West Midland Counties generally experience a mortality above the average; but there are signs of improvement which cannot be entirely accounted for by the flooding of the sewers by the rains. The decrease in the mortality of Wolverhampton, Walsall, West Bromwich, and Dudley, where the water supply was imperfect, is enormous; and in nearly all of them certain sanitary arrangements have been introduced. The deaths in Birmingham and Aston during the last three summer quarters have been

1854, 1814, and 1243: the mortality has fallen one-third part.

It is probable that the ordinary water supply of a place is bad when its

mortality is greatly reduced by heavy rains.

The North Midland Counties lost less by 1045 lives in the last summer quarter (5421) than they lost in the summer preceding. Diphtheria has nevertheless prevailed in parts of Lincolnshire, the inhabitants of which will do well to study the experience of Fiskerton. There diphtheria was very prevalent, and killed II persons. The drainage of the parish was

very defective, "there being open dykes close to some of the houses "containing water, &c. in a putrid and stinking state, without any fall to "pass it away." It was reported to the Board of Guardians by the registrar, the defects of drainage were remedied, and there has been no fresh case during the last month. The district is healthy.

In Belper vaccination is much neglected; small-pox has made its appearance, and has been fatal in 9 cases. Fever has been very fatal in

Dronfield.

In the North Western Counties 13,954 deaths were registered, the deaths in the previous quarter having been 15,506. The system of middens prevails in Lancashire, and the dirt is there not washed away by rain as it is in sewers; which may account for the circumstance that the reduction of the mortality is less in this county than it is elsewhere. The registrars of the West Derby district, a part of which is in the borough of Liverpool, call attention to the diminished rate of mortality. "Sanitary measures," one of them says, "under the Health Act have "greatly improved this district." Scarlatina has been very prevalent in the Lancaster sub-district; it was fatal in 15 cases, and had it not been for the superior sanitary arrangements the registrar believes "it would "have been four times as fatal, for in an ill-drained group of twenty "houses a quarter of a mile from the town the disease was the cause of "a deaths."

The deaths in Yorkshire were 9797, or less by 1189 than the deaths in the summer quarter of the previous year. There is no reduction in the high mortality of the Leeds or of the Hunslet districts; indeed, diarrhæa prevailed there, and the deaths were 1481, or 170 more than in the summer quarter of the previous year. The causes of the high mortality deserve the careful attention of the intelligent authorities of

that important town.

Hull and Sculcoates experienced a great reduction of mortality.

The deaths in the northern counties amounted to 5149, and were to some extent below the average number. Scarlatina and typhus have been prevalent in Durham and in Tynemouth.

The mortality in Monmouthshire and Wales was below the average;

5501 deaths were registered.

The weather of this quarter may be looked at as an experiment on the health of the people. Employment has been easily obtained by workmen, but the prices of provisions have been high. And this general survey seems to establish the fact, that the salubrity of the season is chiefly due to two circumstances; the reduced temperature of summer, and the abundant supply of water by rain. The low temperature retarded the putrefaction of the town impurities; and the water washed them away; so both the forces acting in the same direction, gave a great result. A careful study of the circumstances of each locality by which the result was produced, cannot fail to be instructive; and to confirm the faith of the authorities in the simple sanitary elements with which nature works.

If Wolverhampton is, as the Registrar conjectures, extraordinarily healthy, "because the frequent rains have swilled away the impurities "from which in hot summer weather noxious effluvia arise, thereby preventing the sickness, and diarrhoea more especially, caused by such vapors in the air, and impurities in the water supply," why should Wolverhampton ever be again as unhealthy and as dangerous to its inhabitants as it was before? It is true the town has no command over the rain; but it has unquestionably the power to wash away the impurities from its cesspools and its sewers. Its engineers can supply the town with sweet waters in abundance for the use of the inhabitants. If the Birmingham and Aston district too lose only 1243 inhabitants by death when the town is well washed, why should they ever die again at the rate of last summer when 1815 of the people perished?

The remedy is too simple to obtain immediately all the attention it deserves from the municipal authorities. But they cannot do better than imitate the great oriental dignitary suffering from leprosy, as our towns are now suffering from other diseases, who although he was wroth when told to "wash and be clean," yet finally obeyed the injunction, and was healed.

Fourth Quarter.—October, November, December, 1860.

The Quarterly Returns are favourable, and imply that the population was not only more prosperous but healthier than usual. The marriage rate was slightly above the average, so that the prospects of the working classes were in their own opinion good; the births slightly decreased, and the mortality fell below the average. The improvement in health was greatest in the town districts.

The accounts of births and deaths for the year 1860 show an increase

of the birth and a decrease of the death rate.

Marriages.—101,376 persons married in the quarter; and this is the greatest number that have ever married before in the same season.

The quarterly marriage rate (per cent. per annum) was 2'012, the average being 2.001.

The same excess is observed in the marriages of the year 1860; for 340,312 persons married, and the marriage rate was 1.710, the average rate being 1 694.

The greatest increase of marriages is observed in the manufacturing districts of Yorkshire and Lancashire.

Births.—162,719 children were born and registered in the last quarter of the year 1860; or more by 4757 than were registered in the last

TABLE XVII.—ENGLAND. ANNUAL RATE of MORTALITY per Cent. in Town and Country DISTRICTS in each Quarter of the Years 1850-1860.

The three months January, February, March, contain 90, in leap year 91 days; the three months April, May, June, 91 days; cach of the last two quarters of the year, 92 days. For this inequality a correction has been made in the calculations, also for the difference between 365 and 365°25 days, and 366 and 365°25 days in leap year.

quarter of 1858, and 7372 less than the number in the last quarter of 1859. The birth-rate of the quarter was 3'230; the average of the

quarter being 3.234.
684,048 children were registered in the year 1860; and the annual birth-rate was 3.437, making .020 above the annual average. Taking one day with another through the year, 1874 children were born daily.

Increase of Population.—The births exceeded the deaths in the

quarter by 59,796, and that was the natural increase of the population.

Table XVIII.—The Average Prices of Consols, of Wheat, of Meat, and of Potators, in each of the Years, and in each Quarter of the Years 1852-1860; and also the AVERAGE NUMBER OF PAUPERS RELIEVED on the last day of each Week, in each of the Years and in each Quarter of the Years 1857 to 1860.

In the year the natural increase of England and Wales was 261,327 souls; 716 daily. If Scotland and Ireland increased at the same rate the natural increase of the population of the United Kingdom must have

been at the rate of 1060 daily.

Emigration carried off a part of the increase. In the quarter about 7074 English emigrants sailed from the ports at which there are Government Emigration Offices; nearly in equal proportions to the United States and the Australian colonies.

Prices, the Weather, and Pauperism .- The scarcity or the abundance of

the principal articles of food is shown by their prices.

Wheat was 56s. 9d. a quarter; or 31 per cent. higher in price than it was in the corresponding quarter of 1859. Beef at the Leadenhall and Newgate markets was sold, by the carcase, at $4\frac{7}{8}d$. a pound; or nearly $\frac{1}{2}d$. less. Mutton was on an average $5\frac{3}{4}d$. a pound, and remained the same as in the last months of 1859. The potato crop partially failed; and York Regents, at the waterside market, were sold at 122s. 6d. a ton; or at the rate of $1\frac{1}{2}$ lb. for a penny. The price of this universal article

of food rose progressively in the last three months of the three years 1858-59-60 from 87s.6d. to 102s.6d. and 122s.6d. a ton. To supply its deficiency other antiscorbutic vegetables, fruit, or herbs are required.

The meteorology of the season was peculiar, and is fully described by Mr. Glaisher. The season was unusually cold; and on December 18th, and afterwards, the cold became intense. On Christmas Day, the temperature of the air fell to 7°, on the 29th to 8° Fahrenheit. The extreme temperatures varied in different parts of the country; thus on Christmas Day the temperature fell in Guernsey to 30°, Helston to 32°, Truro to 26°, Ventnor to 24°, and on the south coast to 17° and 20°; these temperatures gradually decreasing in the latitude of 51½° to 6°, 7°, and 8°; and further north to zero; at Nottingham the lowest reading was noted as 8° below zero; further north than 54° of latitude the readings increased to 12° at Alnwick, and 16° at Scarborough.

The atmospheric pressure was also low, and a large amount of rain fell in December; the quantity varying in different parts. The rain-fall of the year at Greenwich was 32 in., at Truro 50.7 in., at Barnstaple

in	the	Year	1860.	By JAMES	GLAISHER,	Esq., F.R.S.

Pauperism gradually declined; and the paupers fell from 826,655 to 793,391, and 788,838 receiving relief on an average during the last

quarters of the years 1858-59-60.

State of the Public Health.—102,923 deaths were registered in the last quarter of the year 1860, and the annual rate of mortality during the season was 2.043. The mortality was 0.140 below the average.

Upon making up the account for the year the deaths are found to be 422,721; and the annual rate of mortality 2 124; or a little more than 21 in 1000. The average of the preceding 10 years is 22. So one life

in every 1000 living was saved.

Yet the mortality of England and Wales is still greatly in excess of the rate experienced in the least unhealthy districts. The deaths instead of 102,923 would at that rate have been 78,833; so during the 92 days 24,000 persons died unnatural deaths in the least unhealthy country

in Europe.

The densest districts are still the unhealthiest. In the population of town districts, exceeding nine millions at the census of 1861, the mortality was at the rate of 23 in 1000; in the country districts, of more than ten millions, the rate of mortality was 18 in 1000; so the chances of dying in the two groups of districts were as 23 to 18. There is a wide field open for sanitary improvement in the country as well as in towns, and it is gratifying to find that the progress is now evident; for the mortality of the town districts has declined from 25 to 23, and of the country districts from 19 to 18.

Upon looking at the country generally we find that the epidemic diphtheria still prevails in parts of the kingdom; measles, whooping-cough, small-pox, scarlatina, fever are also so frequently mentioned in the Registrar's notes that they may be considered prevailing epidemics.

It is the characteristic of these zymotic diseases that they do not depend upon general atmospheric conditions, but are often very fatal in one community, while they are entirely absent from another in the same climate.

In London the mortality was below the average; the deaths were

15,618.

. }

In the SOUTH EASTERN COUNTIES, Surrey, Kent, Sussex, Hampshire, and Berkshire, the mortality was much below the average of the same season of the two preceding years; the deaths were 8161. The deaths in the Invalid Convict prison, Woking, it is said, are dimi-

TABLE XX.—MRAN ANNUAL VALUE Of METEOROLOGICAL ELEMENTS

nished by a better state of the drainage. In an isolated cottage, on an elevated common in Coulsdon parish, Croydon, four children of one family died of diphtheria within a month. Three deaths from the same disease occurred in the family of a bricklayer living in Shenfield (Wokingham, Berkshire). The registrar visited the place. "The house," he says, "is "completely isolated, but is situated on a cold, clayey, undrained soil. "The interior of the dwelling is in a much better condition than that "of cottages generally."

In the SOUTH MIDLAND COUNTIES 6020 persons died; the mortality in nearly every county being below that of the two preceding years. The Watford district in which the mortality was high (144 deaths) was visited by whooping-cough and measles, followed by inflammation of the lungs; the King's Langley sub-district also suffered severely from the former epidemic. The sanitary state of Watford requires attention. Small-pox is still exceedingly fatal in Northamptonshire, and the neighbouring counties have not escaped. 25 deaths from small-pox were registered in St. Giles, Northampton, and 32 in Wellingborough.

In the EASTERN COUNTIES 5253 deaths were registered; less by five hundred than in the corresponding quarter of the previous year. Diphtheria destroyed four lives in a house in Chipping Ongar, two of girls of 18 and 16, two of boys of 10 and 5 years of age. The deaths in Wells, Walsingham, were raised by diphtheria, ague, and remittent fever

assuming occasionally the typhoid form.

The deaths (8301) in the SOUTH-WESTERN COUNTIES were less by 1801 than the deaths in the corresponding quarter of 1858. The reduction was observed in all the counties, Wilts, Dorset, Devon, Cornwall, and Somerset. Wilton suffered severely from scarlatina; Plymouth from small-pox. The high mortality of Redruth is accounted for by scarlatina and whooping-cough. The sanitary state of Redruth is bad, otherwise 354 persons would not have died in the district in three months. Batheaston and Bath have been comparatively healthy.

The 12,020 deaths in the West MIDLAND COUNTIES show an improved state of health, for the number is less by 2527 than the deaths in the autumn quarter of 1858; and the reduction is evident in every county. Bristol, Cheltenham, and Birmingham were comparatively healthy, and so were the usually insalubrious districts of South Staffordshire. Diphtheria is still ranging about the parishes of these counties; it killed ten children in the parish of Great Barrington, Stow-on-the-Wold, and several are still under medical treatment. Shrewsbury lost some lives; the deaths were increased in Oswestry; and in Overton, Ellesmere, sixteen fatal cases of the disease were registered. The registrar of St. Martin, Birmingham, remarks that the continuous rain has effectively cleansed the

sewers, and has consequently diminished the deaths in his very flat neighbourhood. At Leamington 14 deaths from small-pox were registered. The registrar of Holy Trinity, Coventry, says, that the "births" were 180; the deaths 67. Notwithstanding the unprecedented distress which has prevailed in Coventry, consequent upon the utter prostration of the ribbon trade, the rate of mortality has been extremely low, there being only 67 deaths against 132 deaths in the corresponding quarter of last year; 98 in 1858, and 100 in 1857."

The care of the mothers of Coventry has, it would seem, counteracted some of the effects of privation; so the neglect of their homes, by mothers at work in these manufactures, is apparently more fatal than starvation.

In the NORTH MIDLAND COUNTIES the reduction of mortality was great; the deaths from 7986 in 1858 fell to 5889. Each county and nearly every district exhibited improvement. In Nottingham the deaths fell from 732 in 1858 to 414. The mortality was exceedingly high; and it has now fallen within the usual limits. The diminished fatality is ascribed by the registrars to sanitary arrangements, and to the judicious activity of the health officers. Measles has been fatal in 34 cases at

Derby; where the total deaths were 296.

The deaths in the North Western Counties were 17,196; the deaths being nearly the same number as in the year 1859, but less by 2909 than in 1858. Those who have watched the progress of the health of Liverpool will observe with gratification that the mortality of the two districts of Liverpool and West Derby fell successively from 3912 to 3084, and to 2904 in the last quarters of the three years 1858-9-60. The increase of deaths in the Dale-street sub-district is ascribed by the Registrar to the inclemency of the weather, and to the privations and diseases that are caused by intoxicating drinks. In Manchester and Salford there is a corresponding improvement. The young children which were formerly not attended by medical men in illness now obtain the advantages of medical advice, chiefly through the Registrar requiring a medical certificate of the cause of death. It is "a singular instance," Mr. Leigh says, " of a great and salutary change in the habits of a class, effected by a "comparatively simple cause."

11,684 deaths were registered in YORKSHIRE. Measles has pervaded the county; and in some places as in Bradford raised the mortality considerably. In Leeds the mortality declined. The importance of skill in the conduct of the coroners inquests is illustrated by the following two cases in the Malton sub-district:—"In a house in Norton a girl, aged 7 "years, was seized with sickness at dinner on Wednesday, and on the "following morning she died. An inquest was held on the body, when a "verdict of 'convulsions' was returned. Eight days afterwards, in the "same house, a brother of the deceased, aged 6 years, died from 'choleraic diarrhœa,' after two days' illness."

a Approximated to the results of Robinson's Ansmometer by reductions from Whewell's.

Northallerton has been visited by typhus, scarlatina, and measles; wheat, oats, and beans are now standing in the fields covered with snow.

The deaths in the Northern Counties were 6295, exhibiting a slight increase. Scarlatina has ravaged some districts in unfavourable sanitary conditions. During the three months damp, fog, and excessive cold have prevailed at Newcastle. Typhoid fever has been fatal in Low Longtown, and is still prevailing there.

In Wales and Monmouthshire the deaths, 6486 in number, are below the average. Diphtheria has been fatal in some districts, and the registrar of Llanfair notices among the unfavourable circumstances the bad

harvest and the inferior quality of the bread in his district.

The severe weather occurred late in December, and its effects on the mortality will only be fully apparent in the next return.

HEALTH OF LONDON IN 1860.

GREAT cities represent the civilization of their age, and offer great facilities for the study of masses of mankind under singular circumstances. But the materials for this study have been only recently collected. Little more than the stony monuments of the cities of antiquity remain. Babylon had vast walls and palaces; Thebes had a hundred gates, out of which, Homer tells us, twenty thousand chariots issued. But what was the condition of their people? The numbers are unknown. At Rome itself, in later days, the citizen gave in his name and age, with the name and age of his wife and children, to the censors in the curule chairs; but the slaves of the city figured only among the property; so that while the census has supplied history with the numbers of Roman citizens, it has left no records of the population. The deaths of citizens were recorded; but no table of the numbers survives, except of those destroyed at intervals by plague. The marriages, the births, were not reckoned; and only exceptional social phenomena are depicted in the pages of the poets, antiquarians, and historians. So that while the arts have left monuments, literature masterpieces, and physical science treatises, no remains enable us to solve, with precision, any great social problems—to determine the condition of the people, the frequency of different orders of phenomena, the influence of soil, water, air, climate, food, institutions, on human life and on the human race.

The loss is irreparable; but the observations which are now registered in the great cities of the present day—in Berlin, Vienna, Petersburgh, New York, Paris, and London—disclose the general circumstances of their populations, supply exact facts, and suggest means for improving the conditions under which the human race lives, and transmits its life to successive generations.

London is the greatest of the imperial cities; for its population in 1861 amounted to 2,803,989, living in 362,890 houses, peopling streets and squares extended over 122 square miles, along the terraces of land rising from the banks of the Thames.

No observations exist embracing the whole of the phenomena of the life of these numbers of both sexes and of different ages extending over a century, and severally varying in strength, in morality, in intellect, in industry, in health, in occupation, in effectual production and consumption.

But we have now before us the results of observations on a certain class of phenomena. The births, the deaths, and the causes of death are recorded shortly after they occur, and an analysis of the registers has been published weekly for twenty-one years.

The results are as valuable as an experimental philosopher could have deduced from his experiments if he had had the power to expose the population to great vicissitudes of heat and cold, of dampness and dryness; to the changes incidental to differences in the prices of food; to air and water of different degrees of impurity; and to destructive epidemics.

Some of these results were pointed out at the time when the facts were first observed, or in the annual reports, and others will undoubtedly be

elicited by future investigations.

Thus we learn that in the same circumstances the same number of people die at the same ages of the same diseases, year after year; organized bodies being governed by laws as fixed as those which govern the stars in their courses.

Certain changes of condition, within given limits, produce no appreciable effects; but beyond those limits the effects are in some regulated proportion to the intensity of the causes; varying, however, also with the state of the bodies submitted to their action, as is evident by studying the effects on the two sexes at different ages.

Thus excessive heat and cold injure health, and increase the mortality, particularly in the former case, by giving rise to diarrhea, in the latter to diseases of the respiratory organs; the effect generally being greatest in infancy and old age, and varying with age at rates regulated by laws.

The human body consists principally of water, in combination with some organic compounds and salts; and this compound of oxygen and hydrogen is in constant use for drink, ablution, and daily use, so that water is the life-blood of cities. Without water they cannot exist, and on its quality their salubrity depends to an extent which the observations of twenty-one years have determined.

The supply of water in London is derived from shallow wells, from deep wells, from the New River, and from the River Thames, or its tributaries the Lea and the Ravensbourne. The well waters are foul, and nearly all of them have in solution organic matter derived from cesspools.

The Thames has during this period been the great sewer of London, and in the years of the cholera epidemic was found charged with organic matter, of unquestionable origin. The Lambeth Water Company, the Southwark, and the Chelsea, in the first epidemic (1849), supplied the South and West Districts of London with Thames water, from the part of the river extending from Hungerford to some distance above Vauxhall Bridge, and the cholera was then fatal, as the table shows, to 14,125 persons in London, and it was equally fatal in the houses of the same districts and streets that were indiscriminately supplied by the Lambeth Company, which pumped its water from the foulest part of the Thames at Hungerford, and by the Southwark and Vauxhall Company, which took its water higher up the river, but within the tidal range.

It was shown in the Cholera report (1849), that, in 10,000 inhabitants living in the districts supplied with water taken from the Thames at Kew and Hammersmith, 15 died of cholera; that 48 died of cholera in districts supplied with the waters of the Amwell, the Lea, and the Ravensbourne; and that 123 out of the same number died of cholera in the districts supplied with waters taken from the foul part of the Thames between Battersea and Waterloo Bridge. "One, three, and eight," it was added in the report, "express the relative virulence of the epidemic in the three "conditions."*

The Lambeth Company, in January 1852, wisely removed its source of supply at once up to a part of the Thames above Teddington Lock; another company lingered on its old site; and the epidemic cholera of 1854, therefore, found parts of the population of London on the south side of the river in very different conditions; the one supplied with very impure water by the Southwark Company; the other supplied with water much less impure provided by the Lambeth Company. The companies had been in competition, and they often supplied the same streets and districts, so their customers were nearly in all respects in the same sanitary conditions, with one exception; a gallon of the Southwark water contained 3.5 grains, of the Lambeth water 1.4 grains of organic matter. The dejections of the cholera patients of London were in the Southwark water in small quantities, but in quantities sufficient to augment the mortality week after week in every district; and in five weeks 2,284 persons died of cholera in 40,046 houses supplied with the Southwark water, while 294 had died in 26,107 houses supplied with the water taken higher up the Thames.†

† Appendix to Registrar General's 17th Report, page 94.

^{*}Report to Registrar General on Cholera in England 1848-9, page lxi.

The previous deduction was thus confirmed, and the subsequent investigation by a committee appointed by the Board of Health, to inquire into the deaths in every house supplied by the two companies, placed it beyond a doubt that the mortality of cholera in London was augmented by the impuremental which the population was supplied.

by the impure water with which the population was supplied.

It will be remarked that the quantity of organic matter which was so evidently deleterious in the Southwark water amounted, according to the best existing methods of chemical analysis, to two grains in a gallon in excess of that in the Lambeth water; that is, 2 grains in 70,000 grains, or one part in 35,000. A person who drank a quart of the water would take only a grain of organic matter, and still less of the fatal ferment.

Animalcules and muscular fibre have been found in water containing minute quantities of organic matter; it is evident, therefore, that this fluid in rivers, which receive the sewage of towns, must often contain the elements of zymotic diseases, and can never be circulated through a population for any length of time with entire impunity. And water companies may be assured that the purest water is the most salubrious, and that which is likely to retain the firmest hold on the market.

It is therefore of the utmost importance to keep strict watch and ward over the quality of this fluid, which is now supplied to the inhabitants of London by companies enjoying a virtual monopoly under an Act of Parliament, which bound them to alter the sources of supply, or to improve the quality of the water, after the following dates:—

Grand Junction - - 1855, August 31.

Southwark and Vauxhall - 1855, August 31.

West Middlesex - - 1856, August 31.

Chelsea - - 1856, August 31.

East London - - 1856, August 31.

New River - - 1857, June 30.

And this is done much more effectually than it could be by any vexatious inspection of their works, through a careful periodical analysis of the

COMPARISON of the AVERAGE RESULTS obtained in the ANALYSES of the WATERS supplied by EIGHT LONDON COMPANIES in the Years 1851, 1854, 1856, and 1860.

DESCRIPTION OF WATER.	Solid C	onstituent Grain per Ga	ns of <i>Organic</i> llon.	Matter,

,	GOVERNMENT COMMISSION.	R. D. THOMSON.	Hoffmann	R. D. THOMSON, 12 analyses.

The Table may be read thus:—The Grand Junction supplied water of various qualities, a gallon containing of organic matter of various kinds, 3°07 grains in 1851; 1°92 in 1854; 1°38 in 1856; 1°74 in 1869; the latter number being the mean result of twelve monthly analyses.

* This could not have been an ordinary sample of the water.

Digitized by Google

water as it is delivered, by one of the most eminent chemical analysts of the day. The publication of the results of the analysis in the Weekly Tables is perhaps of more utility than the publication of meteorological

phenomena, over which public companies have no control.

The improvement in the water supply of London within the period is great and decisive; and it coincides with the reduction of the mortality. After the Census the data will exist for comparing the rates of mortality in the several districts of London supplied by wells and by the several water companies, with the mortality in towns where the waters are softer and purer.

From the twelve monthly analyses of the waters of each company by Dr. R. D. Thomson in 1860, it will be observed that the quantities of organic matter in the waters supplied by the Chelsea, Lambeth, West Middlesex, and New River Companies are nearly equal (1.67 to 1.69); the Grand Junction and the Southwark waters contain a little more impurity (1.74); the East London still more (1.90): the Kent water is, however, the worst, and contained 1.99 grains. A marked improvement will be observed in all since 1851, when their fatal effects in aggravating the mortality of cholera were first disclosed.

The Table (xxii) will show the rates of mortality during each of the twelve years 1849-60. The death-rate in 1000 living was 22.49 in 1860.

The mortality it will be observed was much below the average in the year 1860; and diarrhoa, which has destroyed every year so many lives, was not half so fatal as it was in 1850.

The mortality has indeed fallen notably since the improvement of the

water supply of London.

And it will be borne in mind that contemporaneously with that measure, Health Officers and Inspectors of Nuisances were appointed in every district of London, under Lord Llanover's Act. This Act has been exceedingly salutary. In conjunction with the Health Officer of the City of London, these gentlemen have suppressed a great number of evils, have supplied the Boards of Works with valuable suggestions, and while they have already effected much good, have laid the foundation for more by their valuable reports.

GREAT BRITAIN.

The rates of marriage, birth, and death in England have been stated, and, with the assistance supplied by the Reports of the Registrar-General of Scotland, the rates that prevailed in Great Britain in the same year have also been ascertained.

In 1860 the number of persons married in Great Britain was 382,548; of children born the number was 789,752; of persons who died 490,776.

The excess of births over deaths was 298,976.

The marriage-rate, or persons married to a hundred living, was less in Great Britain than it was in England, the rate in Scotland (1.386) having been considerably less than that (1.710) which prevailed south of the

Note.—The population of Scotland has been deduced on the assumption that it increased up to 1860 at the same rate as it did in the 10 years 1851-51.

Tweed. The British rate was 1.666. But it was higher than in the previous year, in consequence of an increase in both the English and the

Scottish marriage-rates.

The birth-rate of Great Britain (3.441) was slightly higher than that of England, for the Scotch rate (3.468) was higher than the English, which was 3:437. The English birth-rate of 1860 decreased on that of 1850; on the other hand the Scotch rate increased.

TABLE XXVI.—PROPORTION per Cent. of MARRIAGES, BIRTHS, and DEATHS to the Population of GREAT BRITAIN, 1860.

			Are	ality.	To 100 Persons living.

1856	2,580	1,498	1,999	
1857	3,220	1,889	1,525	
1858	7,363	4,275	3,486	
1839	4,150	2,409	1,965	
1860	8,293	1,919	1,559	l

The number of Deaths in the cols. 3 and 4 were estimated on the assumption that the soldiers abroad belonged to the different parts of the British Empire in the proportions indicated in the next Table derived from the Cansus Report, 1851, Occupations, Vol. I., Supplementary Tables, p. cccxlv., vi. See Table XXIX.

The rate of mortality was 2·138, which is higher than it was in England, but less than in Scotland, where the death-rate rose to 2·233. It will be interesting and useful to compare the rates of mortality in the different districts of England and Scotland, and to appreciate those conditions under which results of a favourable character in one country, and less favourable in the other, were produced, when the more extended abstracts of 1860 for Scotland are published.

In the Report for Scotland for 1855,* which contains a great deal of very valuable information, it is shown that the rate of mortality in that year was 2.06 per cent., whilst in England in the same year the rate was 2.26; and it is added, that "if this proportion be at or near the average "mortality it will prove Scotland to be one of the very healthiest " countries on the face of the globe, and that even England falls far behind Scotland in this respect." But it happened in the year which immediately followed, viz. 1856, that the English rate fell below the Scottish rate for 1855, for the former was then 2"05. It is not necessary, however, to travel out of the year 1855 to discover results which may be advantageously for England compared with analogous results in the Scotch tables. The rate of mortality in the Scotch towns was 2.64 per cent., whilst the rate that prevailed in English towns in the same year was 2.40. The rate in London was 2.43; and it was lower than that of Dundee, Paisley, Glasgow, or Greenock. The strong point of the northern kingdom seems to lie in her rural and especially her insular districts. In 1859 the death-rate of all Scotland was not so high as that of the rural districts of England.

But a comparison between the two countries, and between the principal towns in each, founded on the returns of an extended series of years, will be more satisfactory.

TABLE XXIX .- ARMY SERVING AT HOME AND ABROAD.

	_					1851

	Total		-	-	-	142,870

It was inferred also that the 76,448 officers and men abroad in the army in 1851 should be added to the population of theseveral parts of the United Kingdom, also in the proportions indicated in the above Table. Thus the population of England and Wales at home in 1851 was 17,927,609; add the proportion of the army abroad (86,196) belonging to England and Wales, and its population becomes 17,963,805. The estimated population at home in 1860 was 19,903,918, and the population, including its share of the army abroad, was deduced from the following proportion:—

17,927,809 : 17,983,805 : : 19,902,918 : x=19,948,100 Great Britain was dealt with on the same principles.

Table XXX. — Annual Rate of Mortality per Cent. per Annum, including the Deaths of Soldiers Abroad.

1860	9-142	2.127	2.180	

^{*} First detailed Annual Report of the Registrar General of Scotland, page xxiii.

His Royal Highness the General Commanding in Chief has favoured me with a return of the strength of the British army abroad, and of the deaths in it in 1860. The mean strength was 128,391, and the deaths were 3293. While the strength abroad was greater by 4682 than in the previous year, the deaths were fewer by 857.

It has been shown that the mortality of Great Britain was 2°138. Taking the due proportions of men and deaths for the part of the army belonging to that section of the United Kingdom, the mortality of the population including the army abroad was 2°142. In 1850 it was 2°218.

In France the public health appears to have been much better than it was in the previous year, for the rate of mortality amongst the French people declined from 2.670 (in 1859) to 2.139 (in 1860). The latter rate, though rather higher than that of England, agrees almost exactly with that of Great Britain. The marriage-rate and also the birth-rate

The births in France are exclusive of still-born.

[†] Exclusive of the population of the three newly annexed Departments.

were lower than they were in England in the same year. The respective birth-rates were 2.605, and 3.437. To a thousand of the population in either country the number of English children born exceeded that of French children by eight.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

A return with which I am favoured by the Registrar-General of Seamen shows that there were 3760 deaths of merchant seamen at sea in 1860. This is a greater number than in any of the eight previous years, 1852-9, although "the strength" was less than it had been since 1855. The rate of mortality was 2.19 per cent.; the mean of 1852-60 was 1.90.

The number of deaths of British subjects at sea in 1860 was 397, of which 241 were those of males, 156 those of females. Under this head the deaths of seamen on ship's articles, of soldiers, marines, and invalided seamen from the Royal Navy, are not included.

Two hundred and fifty children were returned as born at sea, viz., 136

boys and 114 girls. The number in five years (1856-60) is 1213.

The following extract from the Edinburgh Review of January 1862 (Art. Wrecks, Lifeboats, and Lighthouses), accounts for the great increase of deaths of passengers in 1859, which are shown in the accompanying table to have been 827; and also for the increased mortality of seamen in 1860:—

"With reference to the two latest years reported upon, viz. 1859 and 1860, it is remarkable, that while 1860 was marked by an almost unprecedented succession of continuous bad weather, and therefore by a greater number of wrecks and casualties from other causes than collisions, than were recorded in any of the preceding eight years, yet the actual loss of life was considerably less; the number of lives lost in 1860 by all causes being 536, and that in 1859 as high as 1645. But the great loss of life in 1859 was mainly attributable to the destruction of two or three fine passenger ships. By two wrecks alone, namely, those of the "Pomona" and the "Royal Charter," 870

TABLE XXXIV.—Number of Births and Deaths of British* Subjects at Sea, exclusive of Soldiers, Marines, invalided Seamen from the Royal Navy, and Seamen on Shipe' Articles, in the Years 1856 to 1860 inclusive, reported by the Captains or Commanding Officers of Vessels to the Registrar General of Seamen upon Schedule C., deposited at the Termination of their respective Voyages in Ports of the United Kingdom.—(Furnished to the Registrar General by the Registrar General of Seamen.)

		Males.	Females.	TOTAL

British subjects are not particularly described upon Schedule C., but foreign names have been excluded from this secount.

. 1 ...

[†] The deaths of soldiers, marines, and invalided seamen from the Royal Navy were 33 in 1856, 59 in 1857, 186 in 1868, 186 in 1869, and 196 in 1860. The number is 640 in five years, which if added to the 2236 above, make 8576, the total number of deaths of British subjects at sea in 1866-60, exclusive of these of merchant seames.

"lives were lost, whilst in 1860 the greatest number of lives lost in any one shipwreck was 37, and the next highest number 31. It appears, from the observations accompanying the Wreck Returns for 1860, that the entire number of lives lost by shipwreck during the last eleven years was 6883. And by another return, which includes the losses by collisions and by wrecks, we find that the total number of lives lost during the last nine years (from 1852 to 1860 inclusive) was 7201, the annual average of losses being 800. It is indeed a startling truth, and one worthy of emphasis, that seven thousand two hundred lives have been lost by marine casualties in nine years."

PROGRESS OF REGISTRATION.

Twenty-nine millions five hundred and twelve thousand six hundred and nineteen names of persons who had been born, had married, or had died, the accumulated contributions of twenty-three years and a half (I July 1837—31 December 1860), had obtained places on the registers at the end of the year to which this report specially refers. The numbers are:—

Persons married - - - 6,7,59,210
Births - - - 13,583,166
Deaths - - - 9,170,243

TOTAL (23\frac{1}{2}\text{ years}) - 29,512,610

In 1860 there were 5636 searches in the Registers at the Central Office,

exclusive of those in the non-parochial registers.

The "Red Book of Lynn," which belongs to the corporation of that town, and is believed by some to be the oldest English paper book in existence, contains as its first entry the transcript of a will, dated 1309. Measures have been taken to preserve it; the leaves, which had been reduced to a loose cottony substance, and had threatened to fall in pieces, have been carefully resized, and there is a prospect that it will last for years to come. This instance of longevity in a manuscript book, which

Obduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Seamen. This return does not include seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals to which such men are sent; accounts of their effects are sent direct to the Board of Trade.

When a ship is lost with all persons on board, the owners return the number and names of the crew, but not of the passengers, to the Registrar-General of Seamen.

If a seaman dies on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel is not to return direct to the United Kingdom. But if a passenger dies en board a ably which does not return to a Shritish port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred.

A column headed *Place of Birth* was formerly contained in the schedule, for the purpose of distinguishing passengers as British subjects or Foreigners, but in many cases it was not filled up by masters, in consequence of their inability to obtain the information after the death had taken place. A column headed "Whether "supposed to be a British subject or Foreigner" might be attempted. British and Foreign seamen are distinguished.

may have suffered some rough handling in the course of nearly six hundred years, deserves to be recorded, because it serves to show that by the use of a good quality of paper, and with due care bestowed on their preservation, it is possible the English registration books may be in existence and even good condition when half a dozen centuries or more have rolled over the dust of the nearly thrice ten millions of persons whose names are now written in them. In not very many generations the registers may have fulfilled in a great measure the main purposes for which, with much care and labour, they have been prepared; but in the progress of years they grow more venerable and valuable as national monuments; and though all the dead are not mighty, and but few are chosen for immortal fame, it concerns the national honour that the names of that vigorous race who planted the fields of England, and built up her commerce, should be legible in the registers as long as the wasting hand of Time will permit.

The number of marriages solemnized by British consuls abroad in 1860 was 151.

Before closing this Report, I may be permitted to advert to a circumstance which has sometimes been made the subject of observation, namely, the interval of time, which to some persons may appear to be longer than is necessary, between the close of the year to which the subjoined Tables relate and the date at which they are ready for publication. In the present instance the preparation of them, and work which must be done antecedently to that preparation, have occupied a period of fifteen months. It has been asked: Why this delay? The question may be put by some whose haste to gain knowledge is not immoderate, but who have not become acquainted practically with the immense labour involved in the construction of statistical tables, and in the calculations based on them. It is put by others whose great desire will not be satisfied till the statistics of the British empire for this current year are laid with the morning journal on their breakfast tables on New Year's day 1863, and who even then, because they live in an age of mechanical invention, for which by some process of thought they take credit to themselves, will not consider

Norm.—The numbers registered in 1887 are for the Half Year ending December 31st.

it their duty to be surprised at so remarkable a result. In answer to the question I have to state:—

1. That this office was established by Act of Parliament, primarily for the purpose of collecting, arranging, paging, examining, correcting, binding, and indexing the certified copies of the English registers, and of supplying stamped certificates of births, deaths, and marriages to all persons who may apply for them; that the certified copies are received quarterly, but the returns are not completed till nearly three months after the end of each quarter; and that the preparatory duties which I have mentioned, and which occupy a majority of the gentlemen engaged in the office during a period of eight months after the quarterly arrivals have begun, must be performed in respect to each volume before it can pass into the hands of the statistical clerks. As the work in the Record Department advances, each quarterly volume is released for the preparation of the statistical abstracts; but it will be seen that the entire number of volumes of any Registration year are not available for this purpose till the September following the termination of the year.

2. That in conformity with a provision of the Registration Act, a general abstract is prepared, in each year, of the number of births, deaths, and marriages registered during the foregoing year, in order that it may be laid before Parliament; but the detailed abstracts that constitute my "Annual Reports" are works of much labour and skill, and necessarily occupy considerable time in the preparation of them. These reports are not designed merely to answer a temporary purpose. They may be regarded as storehouses of facts which have been arranged on methods that are approved as the most useful and convenient, and to which, both now and in future years, students of vital statistics may resort for the elucidation of questions bearing on the social condition of the people, on national progress, on life, health, and disease. It is important that they should be done well. It is desirable only in the next degree that they should be done quickly.

It will be urged that the machinery of Registration should be employed to give immediate warning of epidemic diseases, to trace in contemporaneous reports their beginning, progress, and decline, and to assist in investigating general and local conditions in which they are developed. When the plague is at the door, the people will not wait till its history can be written in a blue book. This is quite true, and it will be sufficient to state in reference to it, that I publish a weekly report for London on the Tuesday following the termination of each week, and a quarterly report for England and Wales within a month after the close of each quarter.

For an account of the Causes of Death in 1860, I beg to refer you to a letter addressed to me by Dr. Farr, which will be found in the Appendix.

I have the honour to be,
Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one Counties proper.

In the other cases the column of the Register headed "Age" is filled in by the Officiating Minister or by the Registrar of Marriages with the words "of full Age," "Minor," "Under Age," as the case may be; thus losing the additional means of identification afforded by a precise statement of the age of persons at the time of marriage. Digitized by

Ages of 4,286 Bachelors and 4,286 Widows who intermarried in 1860.

The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor I ...
Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in what either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from a boundaries of the Counties proper.

[†] Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1860-continued.

The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 631 in number, are arranged according to their local position under the Registration Counties.

Note.—Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

Note.—The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are resisteded by Registrars severally appointed for that purpose.

The letter W deades that the Sub-district contains within its limits a Workhouse belonging to the District or Union; w indicates that a Workhouse belonging to another District or Union is included.

Wherever the misse sign (—) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes sat the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

The Excess of Deaths over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals. For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.

ENGLAND .- SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 112 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a few persons, or diseases which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Thus, mumps was the cause of 88 deaths (Males and Females) in the year 1860, and scarlatina of 9681. The mortality of

CAUSES of DEATH at different Periods of Life, in the Year 1860.

scarlatina, deduced by dividing the deaths from that disease, plus 88, by the total population of England, will be found to differ little from the mortality from scarlatina alone. Where it is desired, partial correction, however, can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as mumps, epistaxis, piles, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120-125.]

NOTE.—Changes were made in the constitution of several of the Districts between 1851 and 1800; the nature and dates of these changes District to another during the interval, the Births and Deaths are returned, for the sake of comparison, as if such Sub-districts had stated for the Districts and Sub-districts as they were severally constituted at the end of 1860, when their limits were the same as at the "Changes have been made in the limits of these Districts."

H. The principal Metropolitan Hospitals are situated in these Districts. w. Workhouses belonging

in each of the TEN YEARS 1851-60-in DISTRICTS.

Norge.—Changes were made in the constitution of several of the Districts between 1801 and 1800, the nature and dates of these cases by District to another during the interval, the Births and Deaths are returned, for the sake of comparison, as if such Sud-districts stated for the Districts and Sub-districts as they were severally constituted at the end of 1800, when their limits were the same as able

* Changes have been made in the limits of the

H. The principal Metropolita: Hospitals are situated in these Districts. w. Workhouses belonging

heach of the Ten Years 1851-60-in Districts.

NOTE.—The letter W denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; to indicates that a Workhouse belonging to another District or Union is included. The principal Hospitals of London are situated in the Sub-districts distinguished by the letter H. Wherever the minus sign (-) is prefixed to the numbers given in the Column

⁽a) Cliffords' Inn (pop. 38 in 1851 and 48 in 1861), and Serjeants Inn, Chancery Lane (pop. 5 in 1851 and 5 in 1861), were transferred from the St. Clement Danes sub-district of the Strand

registered in the 10 Years, 1851-60—in Sub-Districts.

headed "Excess of Births over Deaths," it denotes that the Births in the Sub-distr'ct, instead of exceeding the Deaths were, in fact, less than the Deaths to the extent stated. The Excess of Deaths over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in England, by William Farr, Esq., M.D., F.R.S., D.C.L.

YEAR 1860.

SIR,

I SUBMIT to you the results of the inquiry into the diseases of the

persons who died in England and Wales during the year 1860.

Several of the deaths were investigated by the coroners, a large number was returned by the qualified medical men of the country, others are given on the authority of persons in attendance or present at the death; and of 5767 no account is rendered. The latter numbers are distributed proportionally over the numbers of causes returned in the subsequent calculations.

This great inquest embraces 422,721 deaths.

I. ZYMOTIC DISEASES.

75,849 persons died of the class of epidemic, endemic, or contagious diseases; including all the maladies which, under unfavourable conditions, prevail periodically as pestilences, and were believed by the ancients to be manifestations of divine wrath.

These diseases are indeed often direct results of violations of natural laws by the communities which they infest; and, as they are to a consisiderable extent under control, always demand attention.

The reduced rate of mortality, which is noticed in your Report, is chiefly referable to the decline in the number of deaths from scarlatins,

diphtheria, and diarrhea. A decrease in the deaths from small-pox, typhus, erysipelas, and cholera also contributed to the favourable result. Thus in the two consecutive years 1859 and 1860 the deaths by scarlatina were 19,907 and 9681; by diphtheria 9587 and 5212; by diarrhea 18,331 and 9702. The decrease on these three diseases was 23,230 deaths.

In the year 1858 scarlatina destroyed 30,317 lives; in 1860, as given above, 9681. Fever prevails always epidemically in England, and is the most fatal to men and women in the prime of life. 19,016 lives were cut off by fever in 1857, since when it has slowly declined; the deaths in 1860 being still 13,012.

The ravages of these diseases will be diminished by the progress of public cleanliness, and notably by burying all excreta as manure in the earth; for zymotic disease is propagated by the diffusion through air and water of its infectious principles.

Ague and rheumatism are not now frequently fatal in this country, but they occasion an incalculable amount of suffering, disability, and

secondary disease, which will disappear when the soil of England is effectively drained.

Of the enthetic diseases, syphilis is the most fatal, and the deaths ascribed to it rose from 554 in 1850 to 1067 in 1860. This is naturally one of the maladies of which it is difficult to get complete information;

Table (5).—Causes of Death registered in England in each of the Ten Years 1851—1860.

[†] Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

The number of persons executed in the several years will not necessarily correspond with those in the same years of the "Criminal Returns," insemuch as the executions recorded in each year in the latter are derived from the dates of conviction, while the numbers in this Table are classed under the years in which the deaths are registered. § The cases of angina membranece which would now be put to diphtheria were formerly classed under the same head as scarbeins, but were distinguished in the notes.

and it is not improbable that the increase, rather apparent than real, is

accounted for by improvements in the medical returns.

68 deaths are ascribed to privation, 1002 to the want of breast-milk, 361 to purpura and scurvy, 457 to delirium tremens (generally the effects of drunkenness), and 318 to direct intemperance. The indirect deaths from the want of proper food and from the excesses in drinking, greatly exceeding these numbers, are returned under the diseases to which they give rise.

Worms and other parasitic diseases, so rare now, and so common in the

middle ages, were the causes of 167 deaths.

Table (5).—Causes of Death registered in England in each of the Ten Years 1851—1860—continued.

II. CONSTITUTIONAL DISEASES.

These diseases affect the tissues of the body generally. 82,088 deaths were occasioned by them, including the diathetic order, taking cancer as its type, and the tubercular order, of which phthisis is the representative. The annual rate of mortality was 4.182 in 1000; of which .836 was the

[†] Up to the year 1857 cases of so called "debility" and "premature birth" were classed together; when the new classification was introduced "premature birth" was kept apart, and "debility" and "atrophy" were thrown into one line. This accounts for the changes in the table numbers.

result of diathetic disease, 3.346 of the tubercular maladies. Of cancer, &c. 6,827 died, including 14 cases of the rare disease melanosis, 80 of fungus hæmatodes, 37 of lupus, and 8 of polypus.

^{*} Order 2, comprising Violent Deaths in Battle, is omittel, as inapplicable to t'e c vil population.

Phthisis, the most fatal of all the diseases which afflict humanity, destroyed 51,024 lives; 2.599 in 1000 living, and more than 12 per cent. of the deaths. 520 of these deaths were by hæmoptysis (335 males, 185 females), and 15 by pneumo-thorax, that is by perforation of the membrane covering the lungs. The deaths by this complication of phthisis in the six years were 30, 22, 17, 23, 19, and 15; the fluctuation was thus within narrow limits.

III. LOCAL DISEASES.

We come now to inflammation and its consequences, as well as other affections of particular organs. The class includes 171,037 deaths; or 41 per cent. of the total number.

The deaths by apoplexy and paralysis increased in the year; so did deaths by diseases of the heart. Bronchitis prevailed and was fatal to the

unusual number of 32,347, pneumonia to 25,264 persons. Thus, 68,408 persons died by diseases of the respiratory organs, or 8555 in excess of the deaths by that order of diseases in the previous year. Joint diseases were fatal to more than the average number of people.

IV. DEVELOPMENTAL DISEASES.

70,311 deaths were referred to the four orders of this class; and 28,442 were specifically said to be by old age. That is, less than 7 per cent. of the total deaths were so classed.

The deaths by child-birth were 3173, including 987 by metria (child-birth fever); so, as will be seen by the annexed Table, 46 mothers died to 10,000 children born.

V. VIOLENT DEATHS.

The violent deaths amounted to 14,775; so 7.53 in 10,000 of the people die by violence, or 1 in 1328 living thus terminates his existence; and 35 deaths in 1000, or 1 in 28 is a violent death. 10 were executions, 377 were returned as homicides by coroners juries, 1365 were suicides, and 12,991 were deaths by accident or negligence; 32 violent deaths were not classified. Of the accidental deaths 5417 were deaths by fractures and contusions; and the deaths (3166) by fire exceeded the deaths by water returned (2264); but if we add a due proportion of British subjects drowned abroad, and not registered, the deaths by water will probably exceed those by fire.

The murders and manslaughters are still imperfectly returned. Suicide is most frequently committed by hanging; but many of the suicides by drowning are undoubtedly classed under accidental death, from the want of information. The suicides ascertained are 7 in 100,000 of the

population; 1 in 14,286.

Males and Females.

The difference in the liability of the two sexes to diseases is due in some cases to structure, in others to occupation, in others to dress, in others to passion, and in others to causes which are at present inappreciable.

The zymotic deaths are in the aggregate nearly equal in males and females; diphtheria, whooping-cough, and metria destroying most females; small-pox, croup, carbuncle, diarrhea, ague, and rheumatism most males. Metria is the consequence of child-bearing; and males are probably

TABLE (8).—DEATHS of WOMEN in CHILDBIRTH in the Fourteen Years 1847-60.

more exposed than females to the poisons of ague and rheumatism, but it is difficult to assign any reason for the fact that while 3769 boys under 5 years of age died of whooping-cough, 4436 girls died of the same disease at the same ages.

Syphilis is equally fatal to males (543) and to females (524). If we take adults of 15 and upwards, 154 deaths of females are from this cause, and 87 deaths of males; but the 178 deaths of males—there having been no deaths of females from stricture of the urethra, a common consequence of gonorrhœa—more than redress the inequality.

The 3 deaths of males from hydrophobia, and 4 from glanders, may be traced to the greater exposure of males to their causes.

Of gout 212 men and 56 women die. Gout is not always the consequence of over-feeding; but the excesses in eating and drinking of men at public dinners, and elsewhere, sufficiently account for this excess of mortality by gout, representing a still greater excess of sufferings from the same malady. Delirium tremens killed 407 men, 50 women; intemperance 212 men and 106 women; and this is quite in conformity with what is shown above on the comparative temperance of English women.

Women have a greater disposition to dropsy than men; and while 2100 men died of cancer, 4727 women died of this disease. The frequent seat of the disease in the uterus and in the breasts explains the difference.

Women are also more subject to consumption than men. Table (9) shows the deaths at several ages.

The excess of the deaths of young girls of the age 15-20 is 1142 annually. These sad deaths may be partly the result of organization; but many of them are also partly referable to tight-lacing, to thin shoes, to close rooms, and to the want of exercise in the open air. Young women of 20-40 are also exposed to the same causes, and to others incidental to their condition.

Scrofula, tabes mesenterica, hydrocephalus, cephalitis, convulsions, and epilepsy, or the acute diseases of the brain generally, are the most fatal to males; but chorea (St. Vitus's dance) killed 26 males, 40 females.

Aneurism was fatal to 265 males, 103 females. The large arteries, weakened by deposits, are sometimes ruptured by violent exertions, which men make more frequently than women. Asthma, emphysema, strictly from enlarged or ruptured air-cells, is also more fatal to males than to females. The greater frequency of pneumonia and bronchitis in male than in female children under five years of age is one of the causes of the excess in the mortality of boys; but it cannot at present be explained by differences of structure; neither can the excess in the deaths of males by pneumonia at more advanced ages. The men are, however, more exposed than women to cold weather.

The diseases of the digestive organs, and notably peritonitis and ascites, are the most fatal to women. The peritonitis of the registers is probably in many cases the result of child-bearing, under which it should properly be returned.

Table (9).—Deaths from Phthisis, in the Year 1860, of Males and Females of the Ages 15—55.

			Ages.								
			15-	20-	25-	35-	45-55				
Men	-	-	2158	3380	5555	4498	3113				
Women	-	-	3300	4057	7065	4824	2687				
Excess of Women		1142	677	1510	326	-426					

The diseases of the kidneys and bladder, including stone, are more than twice as fatal to males as to females. This is partly due to the differences of the urethra in the sexes; but the excess of the deaths of men by diabetes shows that this explanation alone is insufficient. 154 males and 25 females died of the painful stone in the bladder; 346 men and 190 women of diabetes.

The diseases of the organs of generation were fatal to 40 men and to 1078 women; including in the latter case 244 deaths by ovarian dropsy.

It is not stated in all cases of this kind, nor in cases of stone, how frequently operations have been performed.

Phlegmon is most common in males, ulcer in females.

4328 boys and 3314 girls, born prematurely, died. More boys than girls die of malformations; the evolution of the male is more elaborate and is more frequently left incomplete in the male than in the female. Spina bifida from the unclosed fissure in the back of the spine is most frequent in females, and may be explained probably by the transcendental anatomist.

The failure in the development of strength and nutritive power is more frequent in males—of whom the deaths of 14,170 were ascribed to atrophy and debility—than in females (12,756).

Paramenia, and the diseases incidental to child-bearing, are of course only fatal to women.

10,667 males and 4109 females died violent deaths. Men are exposed to greater dangers in their daily life than women, and probably more than half the violent deaths of both sexes may be prevented by care and vigilance on their own part, and on the part of their employers.

Of the deaths by accidental fractures and contusions, 4552 males and 865 females died; of those by accidental drownings, 1908 males and 356 females died.

Burns and scalds are more fatal to females than to males in the aggregate; but in the first years of infancy, when the dresses of both sexes are equally combustible, the boys are more frequently burnt and scalded than the girls, who are cautious. From the age of 5 to 10 twice as many girls as boys are burnt; from 10 to 15 the number and the difference diminish; at 15 and up to 45 the exposure of men to fire in coal-mines and works destroys so many of their lives that the deaths outnumber those by crinoline and other combustible articles of dress; after the age of 55 the old women who are now burnt to death far exceeds the number of those of which we read in the cruel times when they were burnt as witches. By lightning and poison more men than women are killed. While 375 unhappy women committed suicide, 990 men committed the same rash act, by gun-shot and other wounds, by poison, drowning, hanging, and other means.

Twelve persons were killed by lightning in the year; and nine were males, three were females. Their employments were out of doors. The deaths by lightning in the four years ending in 1860 were 18, 26, 17, 12; and the numbers represent the periodical disturbances of the electric

tension of the atmosphere. Of 73 deaths by lightning, one only was a young child; 18 were 25-35, 10 were 35-45, 10 were 45-55, 8 were 55-65, and 4 were 65 years of age and upwards.

I have the honour to be,

Sir,

Your most obedient Servant, WILLIAM FARR.

To The Registrar-General.

TO

The Right Honourable Sir George Grey, Bart., G.C.B., M.P., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

> General Register Office, Somerset House, 28th March 1863.

I HAVE the honour to submit to you my Annual Report for the year 1861.

Sir,

The progress of population in England in the last quarter of a century may be stated roundly, and in such a manner, that it may be remembered without difficulty. Each quinquennial period added a million or a little more to the account. In 1836-40 the population was rising through its sixteenth million; in 1841-45 through its seventeenth; in 1846-50 through its eighteenth; in 1851-55 through its nineteenth; and in 1856-60 through its twentieth million. In the middle of 1861 it is estimated to have reached 20,119, 496. The English registration now comprehends within its scope a population greater by the present populations of London, and the three Ridings of Yorkshire combined, than it was when the national system was established in 1837.

In 1861 the marriages were less numerous than they had been in either of the two previous years; the births were more numerous than they had ever been in England; and though the year was healthy, the deaths were more numerous than they had been in 1860, which was still healthier.

In 1861 there were enrolled of persons who married, 82,000 more than had been registered in 1841, twenty years before; 91,000 died more

Table I.—Estimated Population, with the Number of Marriages, Births, and Deaths registered in England, in each Year from 1838 to 1861.

The Population of each of the years since 1851 is deduced from the ascertained rate of increase observed in the twenty years, 1841-61; and an allowance is made for the decrease in the rate during the latter ten years.

than in 1841; and 184,000 children were born *more* than in the same year. The aggregate number of names entered in 1861, as of persons who had married, who had been born, or who had died, is 1,458,032.

On an average of twenty-four years 1639 persons were married, 3318 children were born, and 2229 persons died to 100,000 of the population; but in 1861 the respective numbers were 1628, 3461, and 2163. Marriages were rather below the standard mark of activity. The birthrate was high. The death-rate was below the average.

The excess of births over deaths in the year was 261,292. The conjunction of a high birth-rate with a low death-rate caused that excess to be greater than the usual amount, which in the present stage of the population may be stated as nearly 245,000. About 30,000 English emigrants left their country for foreign and colonial settlements in 1861.

MARRIAGES.

The number of marriages in the year was 163,706. The proportion to the population was '814 per cent.; or in every hundred persons 1.628 were married (the average being 1.639). The marriage-rate has been accelerated since 1849; for in the twelve years 1850-61 it has been in a majority of cases 1.7 per cent., and not in any year below 1.6 per cent.; whereas in the twelve years 1838-49 it was in a majority of years under 1.6 per cent., and only in two instances 1.7 per cent. The prosperity of the people during the later period found its natural expression in the increased frequency of marriages.

Out of the total number of 163,706 marriages, 130,607 were solemnized according to the rites of the Established Church. Of the latter number 102,955 were after publication of banns; 20,090 by licence; 4048 by superintendent registrar's certificate; 16 by special licence. This statement, however, does not represent the real numbers with perfect accuracy, as 3,588 marriages were not distinguished in the registers in respect to

MOTE.—The Table may be read thus:—In the year 1888 to every 100,000 persons living there were f71 marriages or 1842 persons married, 5039 births, 2338 deaths; the number of persons living to every marriage, person married, birth or death, was 130, 65, 88, and 45 respectively. A correction for increase of population has been made in calculating the above results.

these particulars. It will not be far from the truth to state, that for one person who is married after licence, five are married after banns.

The number of marriages performed otherwise than agreeably to the forms of the Established Church was 33,000. Roman Catholic marriages were 7782; those in the registered chapels of other religious denominations 13,182; those of Jews 262; of Quakers 58; while marriages contracted in Superintendent Registrars' offices were 11,725. In 1851 the marriages in the Established Church were about 131,000; in 1861 they were nearly the same number. In 1851 those not performed in the Established Church were about 23,000; in 1861 they were 33,000. It appears from these figures that an increase of 9000, which the total marriages in 1861 exhibited, as compared with those in 1851, was appro-

priated by persons who married according to other rites than those of the Established Church.

In 1861 there were in England and Wales 4564 buildings belonging to Roman Catholics and dissenting denominations, and registered for the solemnization of marriages. A third part of that number belonged to Independents; a thousand to Baptists; 895 to Wesleyan Methodists; 551 to Roman Catholics; 193 to Calvinistic Methodists; 152 to Unitarians; 137 to Scottish Presbyterians; 141 to various other bodies, who have not yet acquired numerical importance.

Although the eleventh division (Monmouthshire and Wales) does not contain half the population of London, there are 710 religious buildings registered for marriages in that division, while in London there are but 300. Cheshire and Lancashire have little more than the population of London, but the registered buildings in those counties are twice as numerous as those of the metropolis.

Re-marriages.—There were more than twice as many marriages between widowers and spinsters as between bachelors and widows; the

^{*} Disregarding the decimal point, this will read 804 marriages were celebrated to every 100,000 of the population; 135 were marriages by licence, 669 were marriages by banns. It may be assumed that these two groups represent the whole of the corresponding classes of society, whether belonging to the Church or not.

respective numbers were 15,067 and 7034. Widows were married in greater number by widowers than they were by bachelors.

In 100 men who married, the proportion of widowers was 14; in 100 women who married the proportion of widows was 9.

The marriages of widowers bore the highest proportion in Somersetshire, where they were 16.8 per cent. of the total number. The smallest proportion was in Herefordshire, where it was 9.62. In the latter county the number of widows who obtained husbands was almost as great as that of widowers who got wives, though on the average of England the number of widows marrying is only two thirds of that of the widowers who marry. After a destructive war, or in districts where men are engaged in unhealthy occupations, there will be few widowers, but many widows; and the alliances which they respectively contract will also be few and many.

For one widower who marries a widow, there are nearly two who marry spinsters.

Minors.—Of persons who married under 21 years of age, there were thrice as many women as men; the exact numbers were 31,927 and 10,415. In 100 males who married 6.36 were not of full age; in 100 women 19.50 had not attained the age of 21 years. In Buckinghamshire, Huntingdonshire, Staffordshire, West Riding of Yorkshire, and Durham, more than a fourth part of the women who married encountered the duties and responsibilities of the married state, while they were still under age. Of young men marrying before their majority the largest proportion was in Buckinghamshire, Huntingdonshire, and Bedfordshire. Life in London appears to discourage and repress early alliances; for the proportions were only 3.48 for males, and 13.51 for females. The expensiveness of house accommodation is, no doubt, one important restraining influence in the metropolis.

Table V.—Marriages in England. The Proportion per Cent. of Minors of each Sex, of Males and Females who signed the Register with Marks, and of Persons who were Widowers or Widows, in each Year from 1841 to 1861.

I			<u> </u>				<u> </u>	

The Table may be read thus by omitting the decimal points:—In England, among every 100,000 persons living 814 marriages took place; of 1,000 men married 754, of 1,000 women 683, signed the marriage register by writing their names; of 10,000 men married 636 were not of full age, of 10,000 women married 1930 were not of full age; of 10,000 men married 1403 were Widowers, of the same number of women married 912 were Widows.

was 40,204, that of women 56,770. But the schoolmaster is abroad over England; and though the absolute number of persons who sign with marks is not reduced within the last twenty years, it has been prevented from increasing with the number of the marriages. In 1861 the marriages were more by 41,000 than they were in 1841; but the men who signed with marks were hardly more in 1861 than they were in that earlier year, and the women were rather less. The mark-signatures fell from 41 per cent. of marriages in 1841 to 30 per cent. in 1861.

Of 100 men and 100 women who married, 75 of the former and 65 of the latter wrote their names in the Registers. In an educational comparison based on the mark-test, there is no English county which stands so well as London; and this superiority holds both with men and women, though only in a small degree with the latter. The proportions of persons in London educated so as to be able to write their names are 89 and 82 in 100 of those who marry.

The greatest amount of ignorance in the elementary art of writing is found in the following counties, where the proportion of marrying men able to write fell below 70 per cent.:—Berkshire, Hertfordshire, Buckinghamshire, Huntingdonshire, Bedfordshire, Cambridgeshire, Essex, Suffolk, Norfolk, Wiltshire, Cornwall, Herefordshire, Shropshire, Staffordshire, Monmouthshire, North and South Wales. In the Welsh division, which includes Monmouthshire, the proportion ranged so low as 60 and 65. Hampshire, Devonshire, Rutlandshire, and still more the East and North Ridings of Yorkshire, Northumberland, Cumberland, and Westmorland, may be mentioned amongst the better educated parts. Generally the men in the northern counties have received more education than those in the southern.

It is deserving of notice that, by the marriage-signature test, the women in Sussex, Berkshire, Hertfordshire, Essex, Suffolk, Norfolk, and a few other counties are better educated than the men; but in the northern portions of the kingdom this anomaly is not observed; and it is a very

BIRTHS.

In 1861 the births of 696,406 children were registered; 355,972 were boys, and 340,434 were girls. These numbers are exclusive of the stillborn, who are not required to be registered. The birth-rate was 3.461 per cent. of the population, or one birth to 29 persons living. It was higher than the mean rate, which is 3.318, or one to 30. The highest that has been obtained since the Registration Act came into operation was 3.504 in 1850.

Sex.—Males were born to females in the proportion of 104.6 to 100. In Northumberland the proportion of male-births was as high as 108; in Rutlandshire nearly as high as 110. Somersetshire presented the only exception to the rule; in that county the boys were in the proportion to girls of only 99.9 to 100.

Seasons.—It invariably happens that births are more numerous in the first six months of the year than in the last six months. If 1000 be taken to represent the average number of births in each quarter, then the proportional numbers in 1861 will run in the March, June, September, and December quarters, as follows:—1007, 1064, 980, and 949.

Children born out of wedlock.—The number of illegitimate births was 44,157; of which 22,728 were births of males, 21,429 those of females. Of every 100 births in wedlock and out of wedlock, 6.3 belonged to the latter category. In London the proportion of the illegitimate was only 4.4 per cent. In Norfolk it was 10.3; in Westmorland (a well-educated county, where men and women can write their names), it was 10.6; in Cumberland 11.2. In Monmouthshire and Wales, where education is low, illegitimacy is not high; the proportion of children born out of wedlock to the total births being 6 or 7 per cent.

Amongst illegitimate children the proportion of males born to females is higher than it is amongst the legitimate.

It has been shown that the birth-rate of England (without reference to the distinction of legitimacy) was 3.46 in 1861. But the rates in the

Table IX.—Births in the Years 1845-61 in England, distinguishing the Legitimate and Illegitimate.

1861	693,406	652,249	44,157

several counties exhibited considerable variety. Amongst the least prolific populations were those of Surrey (the extra-metropolitan part of it is here referred to) and Sussex, where the rate was 3.05; and though in Kent (extra-metropolitan) it was 3.30, it is found that the birth-rate was

low in the districts adjoining the metropolis, which most readily absorbs within its vortex the men and women of marrying age who live near the edge, and who otherwise would form connexions at their homes. But the lowest example of birth-rate was found in North Wales, where it was 2.953. The highest were in Warwickshire 3.69; in Lancashire 3.77;

in the West Riding 3.71; and in Staffordshire and Durham the birth-rates rose to 4.02 and 4.03.

DEATHS.

The deaths of males were 222,281; those of females were 212,833; the total 435,114. The death-rate was 2 163 per cent. The mean rate of 1852-61 is 2 221.

England was generally healthy. The mortality was below the average in all the counties, with the exception of those that follow:—Bucking-

hamshire, Huntingdonshire, Cambridgeshire, Suffolk, Norfolk, Shropshire, East and North Ridings of Yorkshire, Northumberland, Cumberland, and North Wales.

Sexes.—Males died at the rate of 2.268 per cent. of the male population. Females died at the lower rate of 2.063 per cent. of the female population. If equal numbers living of the sexes are taken, the deaths of males were in proportion to those of females, as 110 is to 100. But in the population as actually constituted, the females have a great preponderance, and the deaths of males were 104 to 100.

Seasons.—The mortality was below the average in each quarter; but the spring quarter was comparatively the healthiest. The following is a summary of the Quarterly Reports.

SUMMARY OF THE QUARTERLY REPORTS, 1861.

First Quarter-January, February, March, 1861.

The state of the public health during the winter has not been on the whole unfavourable, and the mortality has been rather lower than the average. The decrease of the birth rate may be partly due to some arrears of registration, arising from the employment of the Registrars in making arrangements for taking the Census. The marriages, which were numerous in the concluding quarter of 1860, fell under the pressure of adverse circumstances in the first quarter of 1861.

Marriages.—The number of persons married in the winter quarter was 66,548. Of ten thousand of the population 135 were married, but if the marriage-rate had been equal to the average for that quarter, the number would have been 142. Tables that run through a series of years show that the people are less inclined to enter into wedlock in the first than in any of the succeeding quarters, and in the present year that season was eminently unprepitious in consequence of the severe frost and dearness

TABLE XIV.—Annual Rate of Mortality of Males and of Females in England, 1238-61.

The Table may be read thus:—In the year 1838 to every 100 males living there were 2°335 draths of males; to every 100 females living there were 2°138 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the relative mortality of males and females; and that out of equal sumbers living the deaths of males were 109 to every 100 deaths of females in 1838.

Digitized by Google

of provisions. The average weekly number of recipients of in-door and out-door relief exceeded by 53,296 that relieved in the winter of 1860. From a comparison of corresponding quarters of 1859-61, it appears that the decline in marriages was general over the country. In London they fell from 5751 and 5665 to 5305; in Staffordshire from 1497 and 1426 to 1217; in South Wales from 1173 and 1205 to 1021. Kent and Oxfordshire were exceptions to the rule, for in those counties marriage was brisk. Sturminster, Blandford, Dorchester, Sherborne, Beaminster, and Bridport

The Table may be read thus, without reference to the decimal points:—In the March quarter of the year 1833, to 100,000 of the population of England there were 3,038 births, and 2,615 deaths registered. The three months January, February, March, contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

Digitized by Google

births registered in the corresponding quarter of the previous year, when the number was unusually high.

The birth rate of the quarter was 3.500 per cent., the average being 3.504 per cent.

Increase of Population.—The registered increase of population in 90 days was 51,718; and it was at the rate of 575 daily.

There is no account of the immigration; but according to the returns about 4640 persons of English origin sailed in the three months from the ports at which there are agents; 2065 to the United States, 2019 to the Australian colonies, 25 to the North American colonies, and 531 to other

From the United Kingdom 16,537 emigrants sailed.

Prices, the Weather, and Pauperism.—All these matters are connected together, and affect the public health. The price of wheat was 55s. 1d. a quarter; and it exceeded by 10s. 8d., or 24 per cent., the price in the previous winter quarter.

The mean price of beef at Leadenhall and Newgate markets was $5\frac{1}{8}d$, and of mutton $6\frac{1}{8}d$. per lb. Best potatoes were 147s. 6d. a ton.

The mean temperature of the quarter at Greenwich was 39.9°, or 1.8° above the average of 90 years; the dew point was 38.7°, or one degree above the average; so the degree of humidity was 80, also above the average, shown still further by the fogs which prevailed throughout the country during the greater part of the month of January, 16 days in February, and 6 days in March. Snow fell on 38 days; and the amount of rain-fall was 4.5 inches, giving half an inch below the average. The air moved horizontally at the rate of 11 miles an hour. The barometer was slightly below the average; high in January; low in March. The meteorology was in some respects extraordinary; the temperature of January was excessively low, while the temperature of February and March was above the average. The cold set in on the 3d of January, and increased until on the 9th of January the temperature at night fell to 11°, whilst the highest temperature of the following day was 24°. In many districts Mr. Glaisher shows that the temperature fell lower than it fell at Greenwich. The temperature of the first half of the month, 28.3°, was lower than the temperature of the same period of any of the last 20 years. Of extremely cold Januaries 11 occurred in the 30 years 1770—1800; II in the next 30 years; and only 5 in the 30 years ending in 1861. The immediate effect of extreme cold is to destroy the lives of many aged persons, and those suffering from asthma and other chest diseases; large numbers are also thrown out of employment.

The untowardness of the season consequently threw a large number of the poor on the parish, and 889,088 paupers on an average received relief. This number exceeded by 53,296 the paupers on the lists in the previous winter.

State of the Public Health.—121,215 deaths were registered in the quarter; and this number was rather lower than the number of deaths in the winter quarter of the preceding year.

The death-rate was 2.453; the average rate of the season being 2.482. The increase of the population in particular parts of the country is uncertain; but assuming that the estimated rates of increase are tolerably correct, the mortality (2.658) in the town districts was about the average, whereas the mortality (2.210) in the country districts was below the average.

121,215 deaths were registered in the quarter; and as at the rate prevailing in the least unhealthy districts the deaths would have amounted to 88,355, the unnatural deaths may be set down as about 32,860, referable directly to the circumstances unfavourable to life in which the population is living. Painful as this recorded loss of life is, it is yet

gratifying to know that nearly all those fatal circumstances admit of

mitigation by sanitary measures.

The health of London during the winter is described in the Summary of the Weekly Tables. The deaths, 18,614, amounted to about the same

number as occurred in the previous winter.

In the South Eastern Counties the mortality was somewhat lower The mortality was high in the Woking sub-district, Surrey. In two families 5 persons died of diphtheria; and the fatal cases that have fallen under the notice of the Registrar, have been in parts badly drained, with a clay subsoil. Brenchley, Hythe, and Folkestone in Kent have been visited by scarlatina, measles, whooping-cough, or fever, which have raised the mortality of the districts of Tunbridge and Elham. Sussex has been generally healthy. In Brighton, however, 431 persons died. And in the sub-district of Worth diphtheria attacked several persons, but all except one patient recovered under early treatment. Here diseases of the mucous membranes have prevailed, chiefly in low situations, with cesspools; and they have been attributed generally to the cold, damp air, and unwholesome food. The practice, the Registrar justly says, of depositing dirt in pits contiguous to the back doors of houses is very injurious; and the people of Worth should look to it in time, otherwise severer plagues may visit them.

The deaths (6950) in the SOUTH MIDLAND COUNTIES are below the average number; and it is only in Huntingdonshire and Cambridgeshire that there is a slight increase. Small-pox was nevertheless exceedingly fatal in some parts of Northamptonshire. In the St. Giles's sub-district of Northampton alone 21 deaths from small-pox are registered; in the sub-district of Wellingborough it attacked a large number of adults, and 24 victims perished. In Daventry 8 deaths, in Peterborough 4 deaths were wrought by the same agency, which might have been arrested by vaccination. The loss of life in considerable towns is doubly deplorable, as information and the means of relief are within the reach of the parents who see their children die. In addition to small-pox, diphtheria broke out in the Huntingdon district; and in Caxton, Cambridgeshire, 11 deaths from diphtheria occurred, 3 happening in one family within 11 days. This epidemic, with whooping cough and measles, account for the increase of mortality in the two counties.

The Eastern Counties, exposed to the winds that blow from the continent over the German Ocean, experienced a lower rate of mortality than prevailed in the previous winter quarter. The deaths were 6225. Several cases of diphtheria were fatal in parts of the districts of Chelmsford, Cosford, Flegg, and Freebridge Lynn. In East Dereham the deaths exceeded the births; and the severe weather induced fatal bronchitis in

this and other districts.

The South-western Counties also experienced a reduced rate of mortality and the deaths amounted to 9957. The city of Salisbury lost only 32 of the inhabitants by death; and other districts were equally favoured. No death was registered in the sub-district of Bradworthy, comprising a population of about 1000. A lady of 103 years of age, wanting five days, died in March at Shaldon in the Teignmouth subdistrict. It is another of the rare instances of individuals of our race living through the whole of the natural cycle of human existence. The evidence of these extreme ages should be always carefully investigated. Small-pox has been prevalent in the district of Totnes; diphtheria in Torrington, Camelford, and Taunton. Seven persons were drowned by shipwreck in January off the coast of Penzance; and the deaths were 40 above the average in the sub-district of St. Just in Penwith. Whoopingcough was very prevalent in Camborne, Redruth, as well as in Penzance: and some deaths from scarlatina and typhus were also registered there. Bedminster, the last district in Somersetshire, suffered from measles, which caused an increase of deaths. The adjoining registrars of Bristol do not

account for the increase of the mortality in their district; but the registrar of Clifton notices the fatality of whooping-cough and bronchitis, which he refers to the long continuance of easterly winds.

The West Midland Counties (Gloucester, Hereford, Salop, Stafford, Worcester, and Warwick), experienced a reduced rate of mortality; and 14,520 deaths were registered in these counties. Diphtheria was rife in the district of Stow-on-the-Wold; and 7 deaths from the disease were registered in Bourton-on-the-Water. Shrewsbury suffered from measles; and the mortality of this county town is much above the average, not only of healthy districts but of London. Its sanitary evils undoubtedly admit of remedy, as it occupies an admirable site on the Severn.

By a very laudable regulation, the sextons in Newcastle-under-Lyme are not allowed to bury still-born children without a written permission; and the registrar states, that as such cases have been numerous during the quarter, the number of children born alive and registered under the Act is materially diminished. Besides suffering from the severe weather the people of Birmingham suffered from the bad state of trade, "which

necessarily involved great privation among the working classes."

In the NORTH MIDLAND COUNTIES the 7278 deaths were below the average.

20,271 deaths were registered in Lancashire and Cheshire; the increase on the preceding winter quarter exceeded a thousand. The mortality increased in the districts of Liverpool and West Derby, and decreased in Manchester and Salford. Ashton, Oldham, Chorley, Preston, and Fylde also experienced an increase in their rates of mortality. The Registrar of Deansgate, Manchester, points out the singular absence of zymotic disease. But the mortality among children is high; as it was also in Spotland-further-Side, Rochdale, where the registrar thinks many of the deaths of children may be accounted for by the fact that their mothers work in the factories up to within a few weeks of their confinement.

12,845 deaths were registered in YORKSHIRE. The number differs little from the numbers in the two previous winters. Diphtheria has prevailed to some extent in York; and the mortality was there above the average, as was also the case in Bradford. The deaths in Leeds and Hunslet were 1615; in Sheffield 1001. In Northallerton 15 out of 89 of the children born were of illegitimate birth; which is partly, perhaps, explained by the fact that two only of the parents of twelve children in a township could write their names.

7129 deaths were registered in the NORTHERN COUNTIES, where the mortality has been unusually high from the prevalence of scarlatina, diphtheria, typhus, and measles.

In Wales and Monmouthshibe the 8003 deaths were below the average number. Considerable depression prevails in some of the iron works; but the masters continue to give employment to their men as far as is practicable. At Llanfair the bread is unwholesome, provisions dear; and the deaths exceeded the births in number. But the returns are rarely of this unfavourable character.

Second Quarter-April, May, June, 1861.

The leading facts of the Return may be briefly stated:—The marriages were comparatively few in the first quarter of this year; they became more numerous in the second quarter, which indeed happens invariably in England; but still they did not quite attain the average for the June quarter; many more children than usual were born in the second quarter of this year; and in the same period fine weather, and perhaps other than meteorological causes, were on the whole favourable to health, for the death-rate was not quite so high as the average.

The POPULATION resident in England as enumerated at the Census of 8th April 1861 was 20,066,224. The rate of increase in the last

decennium was 12 per cent.

Marriages.—The number of persons married in the spring quarter was 84,024. The marriage rate was 168 to ten thousand of the population, which is less by 3 than the average, and less by 9 than the annual number married in the same quarter of 1860, when as is shown by the Returns of the Poor Law Board, the labouring class were in a more thriving condition. By surveying the eleven great divisions of England, as these are constituted in the Tables, and with reference to their several contributions to the marriage-list, this result will be discovered that there was a decrease of marriages last spring as compared with the same period of 1860 in all of these divisions except two. The Southeastern counties, especially Surrey, maintained a fair proportion; and in the Northern counties there was a very manifest increase. Durham, Sunderland, Gateshead, Tynemouth, and Carlisle were in a prosperous condition, if, as may be presumed, a willingness in the unmarried to form the marriage relation, and a confidence in their ability to undertake its responsibilities, be the test of prosperity in England.

Births.—The number of children born in the quarter that ended June 30th was 184,820, which is higher than the number born in any quarter of any previous year. The birth rate was very nearly 37 per 1000 of the population, whilst the average is less than 36. In only one of the forty-two quarters that have passed since 1850 has the rate exceeded 37 per 1000. All the counties, with a few exceptions, of which Rutlandshire may be mentioned as one, contributed a portion, more or less of the increase of last quarter. In London the births rose from 22,251 in the spring quarter of 1860 to 24,916 in that of the present year. In Devonshire they rose from 4316 to 4758. Manchester, Salford, and Chorlton exhibited a considerable increase; in West Derby, also, the births were numerous; but in Liverpool they did little more than

maintain their level.

Increase of Population.—The increase of population as disclosed by the registers of births and deaths was 77,262, for to that extent the former exceeded the latter. The rate of increase was equal to 840 daily.

According to the emigration return, about 8505 persons of English origin left ports in the United Kingdom, of whom 5241 were bound for the United States, 776 for the North American Colonies, 2155 for the Australian Colonies, 333 for other places. The total number of emigrants, including about 1700 foreigners, was 37,987, of whom 25,562 went to the United States. The Irish element formed nearly two thirds of the whole emigration. The Scottish part of it showed a clear preference for Australia.

Of persons who enter this country as travellers or settlers no account can be rendered.

Prices, the Weather, and Pauperism.—The price of wheat was 54s. 9d. a quarter, and was higher by 2s. 1d. than in the previous June quarter, and by 7s. 6d. than in that of 1859. The mean price of beef in Leadenhall and Newgate markets was 5\frac{3}{8}d.; both highest and lowest prices were less than in the same quarter of 1860, which also held in respect of mutton, the mean price of which was 6\frac{1}{4}d. Best potatoes averaged 130s. per ton; they were dearer than in the same quarter of 1859, cheaper than in that of 1860.

The mean temperature of the air at Greenwich was 51.8°, which is 0.4° below the average for the same three months in 90 years. The weather was cold till the middle of May, when it became comparatively warm, and there was from the 20th of that month to the end of June an average daily excess in the temperature of one degree. On May 23d the temperature reached 80°; the highest temperature of last year occurred on the same day, but did not exceed 76.5°. It reached 82°, nearly, on

the 19th June. The fall of rain in the quarter was 4.5 inches, which is 1.3 inches below the average. There was snow on 27th April in great part of the country; it fell on the 4th May at Brighton, Banbury, Berkhampstead, and Bywell. Full meteorological details by Mr. Glaisher are

subjoined to this Report.

Weather of singular severity in January inflicted great suffering on the poor, and the number of persons entitled to in-door and out-door relief was swelled to unusual magnitude. The paupers on the lists in the subsequent spring quarter (April, May, June) were reduced, but were still very numerous, and on a weekly average were 831,587, against 799,434 in the corresponding season of last year.

State of the Public Health.—The number of deaths in the quarter that ended June 30th was 107,558; in the same period of last year it was 110,860. The annual death-rate for the quarter was 215 to ten

thousand persons living, whilst the average is 221.

Both town and country populations have enjoyed a slightly improved degree of health; for dividing England into two portions, one chiefly urban and nearly equal in amount of population to the other chiefly rural, it appears that the rate of mortality in town was 228 per 10,000 (against an average of 235), and that in the country it was 200 against 204. In either instance the result of comparison is on the side of salubrity, though as regards the country the degree of improvement is almost imperceptible. The difference in the rates of country and town during this quarter may be stated thus:—Taking equal populations, for 200 persons who died in the former, 200 + 28 died in the latter.

If the rate of mortality that is found to rule in the least unhealthy districts had prevailed this quarter throughout England, the total deaths enumerated would have been, not 107,558, but 85,852. Consequently a certain portion of the registered mortality may be termed unnatural, and is represented by 21,706 deaths. This large contribution levied on human life is to a great extent the penalty paid for ignorance or neglect of those social arrangements which it is the business of sanitary reformers

to invent and to recommend.

The deaths in London were 15,230, against 13,801 and 14,932 in the two corresponding quarters of 1859-60. Whooping-cough was unusually fatal, and in thirteen weeks carried off 1151 children. Zymotic diseases were the cause of rather more than a fifth part of the mortality. The

metropolitan population was 2,803,089.

In the SOUTH EASTERN COUNTIES, which contain a population of 1,847,661, the deaths were 8239, and exhibited a decrease on the returns of two previous corresponding quarters. They were to the births as 8 to 14. The following places may be cited as examples of comparative health in the recent spring: Farnborough, Tenterden, Romney Marsh, Brighton, Midhurst, Westbourne, Southampton (where there were 185 deaths to 404 births), Winchester, and a great portion of Berkshire. The registrar of South Bersted (Chichester) remarks that his number of deaths was by far the smallest he had registered, though the population had increased; that "the weather had been very dry, and illness had been "less than had been known in the corresponding months for many years." Diphtheria visited Woking and Ripley in the district of Guildford, Farnham and Horsham; and at Rotherfield in Sussex 10 cases of that disease are reported. Thirteen deaths from measles were recorded at Folkestone, and it continued to prevail there.

The population of the SOUTH MIDLAND COUNTIES is 1,295,497, and the deaths were 6484. Though the mortality of this division was not so high as in the same period of 1860, the returns from many parts of it indicate a rather unfavourable condition of health. The deaths in Amersham in Buckinghamshire rose to 118, and at Beaconsfield, which is part of that district, the deaths much exceeded the average, and were considerably more numerous than the births. The registrar of Beaconsfield

mentions some fatal cases of malignant scarlatina, and adds that the poor people are not accustomed to sufficiently ventilate and purify their dwellings. In Northamptonshire generally the mortality was not high, and in Northampton it was low, the deaths in this district being 227 to 419 births; but at Peterborough and Eye small-pox was prevalent, and at the former place there was also diphtheria, which was fatal in 7 cases. Some districts in Cambridgeshire returned an increased number of deaths, viz., Caxton, Ely, North Witchford, Whittlesey, and Wisbeach. "At the present time," says the registrar of Chatteris in North Witchford district, "there are but few houses in my sub-district free from measles;" and the workhouse at Wisbeach, in which the mortality was considered to be high, is stated to be crowded with inmates, and defectively drained.

The Eastern Counties, with a population of 1,142,580, returned 6092 deaths, against 6226 in the June quarter of 1860. The numbers were heavy in Ipswich and Hoxne districts. At Stebbing in Essex the deaths were nearly double the average. At Wenhaston in Suffolk measles was very prevalent, and defective drainage is reported in connexion with some deaths from scarlatina that occurred there. Four children died in one family at Kessingland from diphtheria. In the districts of Yarmouth and Norwich the mortality was very high. In the latter, and also at

Wells, measles was exceedingly prevalent.

The South Western Counties, with a population of 1,835,714, rather less than that of the South Eastern, exhibits higher returns both of births and deaths. But though the former division was not so healthy as the latter, it was apparently healthier than usual, for there was a decrease of deaths in each of its five counties, although small-pox attacked Exeter, Totnes, Plymouth, Liskeard, St. Austell, Truro, and Taunton. The registrar of Totnes describes the increase of this disease as "almost alarming;" and at St. Clement, Truro, "the deaths were greatly in excess of the average; small-pox prevailed to a great extent and proved fatal in many cases." In this sub-district public vaccination had been greatly neglected; it is stated that a whole period of a year and a half elapsed without the performance of a single vaccination by the public vaccinator. Of 134 deaths in Bedminster (sub-district) no less than 54 were from measles.

The West Midland Counties. Population 2,436,568. The deaths were 12,721, showing a decrease on the numbers in two previous springs. They were to the births in the proportion of only 12 to 22. Measles was the prevailing complaint in this division, and it raised the mortality at Bristol and Clifton. In St. Philip and Jacob (Clifton) it was fatal in 12 cases in May and 39 in June. It was reported also at Stow-on-the-Wold; at Munslow, Pontesbury, and Wombridge in Shropshire; at Dudley in Staffordshire; at Belbroughton (Bromsgrove) in Worcestershire; at Birmingham and Deritend (Aston) in Warwickshire. There were 22 deaths from scarlatina at Horsley (Stroud); and diphtheria has been very prevalent at Ellesmere, and caused a fourth part of the mortality in that sub-district.

The North Midland Counties contain a population of 1,288,928, which, though not quite equal to that of the South Midland, registered a higher number of deaths, namely, 6962 in the former division against 6484 in the latter. The same remark applies to the births. There was no decrease of deaths in any of the five counties except Nottinghamshire, and in this instance the result did not, apparently, flow from better health, but from want of employment which thinned the population of some parts. Measles prevailed in Leicester, and of 458 deaths 99 were from that disease, which also in a very malignant form attacked the children in Boston workhouse. It was fatal also in Derby. Eight out of 52 deaths were from diphtheria in Caistor in Lincolnshire; 5 of these at North Kelsey.

NORTH WESTERN COUNTIES. Population 2,935,540. Deaths in the quarter 17,576. It is a fact well worthy of notice that Lancashire with a population less than that of London by about 338,000, and living on an area nearly seventeen times as large, returned almost as many deaths as the metropolis, for the difference was only 171. If sanitary work is still to be done in London, it is evident that the want of it is exceedingly urgent in the seats of manufacture and commerce in the north. There were 4 deaths from diphtheria at Barrow, a village near Chester; and this complaint, with scarlatina, which prevailed in ill-ventilated and overcrowded cottages, caused 11 deaths at Bollington in the district of Macclesfield.

In YORKSHIRE, with a population of 2,015,541, the deaths were 11,576. The village of Seaton Ross in the East Riding suffered much from malignant scarlatina. Measles carried off many children in Guisbrough. The bad ventilation of the lead mines in the parish of Arkengarthdale in the North Riding has, as the registrar believes, affected the health of the workmen.

In the Northern Counties 6575 deaths occurred in a population of 1,151,281. Of 180 deaths in Hartlepool 35 were from scarlatina, which also invaded Gateshead, Durham, Stockton, and Hexham.

MONMOUTHSHIRE and WALES have a population of 1,312,834; and they returned 7480 deaths in the quarter. The health of this division generally appears to have been good. The mortality was comparatively high in Aberystwith, Wrexham, and St. Asaph.

Third Quarter.—July, August, September, 1861.

Returns have been obtained of marriages in the first nine months of the year, and they show that if the progress of population is taken into account the number of alliances formed was low during the whole of that period. The children born in the September quarter decidedly exceeded the number which the average birth-rate for the same period would have produced; whilst the rate of mortality in the same three months, though it differed little from, was not so high as the average rate for that season, which is the healthiest of the year. This statement exhibits the most prominent features of the Return.

Marriages.—Of persons who married in the summer quarter (the third) the number was 79,768. As compared with those for the same period in 1860, the returns of all the eleven divisions show a decrease, except those of the south-eastern counties, the south-western, Yorkshire and the northern counties. Marriages were few in Northamptonshire, numerous in Cornwall, few in Staffordshire, Derbyshire, and South Wales, numerous in Durham and Northumberland.

The marriage-rate was 1.57 per cent. against the average rate, 1.62. It has rarely been so low as it was in the summer quarter of this year.

Births.—There were 172,133 children born in the summer quarter (ending Sept. 30th). In the summer of 1860 the number was 164,121. The annual birth-rate derived from ten summers is 328 for ten thousand of the population; in this quarter it was 339. Comparing the two quarters of 1860-61, and viewing the numbers absolutely and without reference to the increase of population, it appears that there was an increase of births in all the eleven divisions, except that of Monmouth-shire and Wales in which they were stationary. But this division would have furnished no exception to the rule of increase, if the character of its returns in their aggregate were not unfavourably affected by Merthyr Tydfil, Bridgend, Swansea, Newcastle-in-Emlyn, and Crickhowell in South Wales, in which parts a decrease has occurred both in marriages.

and births, chiefly perhaps in consequence of the migration of persons connected with the industrial operations of those districts.

Liverpool with a population of 269,742 produced 2158 births, whilst Manchester with a less population, 243,988, returned 2278. In London the births in the quarter were 23,597; in Lancashire they were 23,201.

Increase of Population.—The natural increase of population is the excess of births over deaths in a given time. This excess was 70,901 in the quarter, or an average of 771 in a day. The natural growth is weakened or strengthened by migration.

In the quarter 19,892 persons left ports in the United Kingdom, at which there are Government emigration officers. Of these, 6348 went to the United States, 4930 to the North American Colonies, 7100 to the Australian Colonies, 1514 to other places. Of the total number of emigrants 8942 were of English origin, and of these a large proportion chose the Australian Colonies. The Scotch preferred the North American Colonies to the United States.

In the summer quarter of 1851, the total number of emigrants from the United Kingdom to the United States was 68,931, in that of last year it was 21,104, and in the present year the number for the quarter declined to 6348. British North America has received a certain number of those, who would have preferred the United States in a more peaceful time; but a great majority have decided to remain at home.

Prices, the Weather, and Pauperism.—The average price of consols in the quarter fell to $91\frac{3}{8}$. The average price of wheat per quarter was 52s. 1d., which is less by 7s. than it was in the same quarter of 1860, but higher by 8s. than in that of 1859. Both beef and mutton are cheaper than they were at the same time in 1860. The average price of the best potatoes has fallen in the same periods from 135s. per ton to 97s. 6d.

The meteorological character of last summer was so far different from that of the summer which preceded it, that its mean temperature at Greenwich was 60°4°, having been higher by 4°2°. Till August 3d, the temperature of the air was generally rather below the average; warm weather set in on the 4th, and continued thirty-nine days; from September 12th till September 27th, the weather for the most part was cold. On August 12th the mean temperature was 72.9°, nearly 12° in excess of the average, and higher by 10° than the highest mean temperature in 1860. On the same day the thermometer in the shade rose to 80°5°, or 13° higher than the highest point in 1860, which was 76°5° on May 23d, The temperature of the last day of September was remarkable; the mean was 61'5°, and the highest 74°; and going back as far 1814, this is the only instance in which the mean temperature of September 30th, reached . Hardly more than half an inch of rain fell in August; the total fall in the three months was 41 in., which is 31 in. below the average of forty-six summers. In July the weather was unsettled all over England; in the other months it was very fine, with little rain in some parts; but unsettled with much rain in others. For these and other interesting facts, stated in greater detail, Mr. Glaisher's Report, which is subjoined, may be consulted.

The Registrar of Poulton-le-Fylde, in Lancashire, mentions that the crop in his district was nearly an average, and had been secured in excellent condition. The Registrar of Pudsey (Bradford), attributes the health of his district to fine weather and wholesome food "at a moderate price." The Registrar of Northallerton states that the season has been very favourable, and "the crops well got in;" and the report from Chester-le-Street in Durham is, that the produce is abundant and gathered "in prime condition." The Registrar of Kington, in South Wales, says:— "Weather unusually warm, and harvest completed in excellent order; the crops light, but of good quality." At Bettws-y-Coed in North Wales

the weather was very wet in July, but the two other months "rather fine;" but in West Ward, Westmorland, "since the middle of July the weather has been extremely wet and changeable."

The returns of pauperism, which were heavy in the early part of the year, continued heavier in the summer quarter than they were in the

same period of 1860.

State of the Public Health.—The number of deaths registered in the three months was 101,232, or considerably more than in the summer quarter of 1860, which was 86,312, but less than in that of 1859. And over England the fluctuation in the deaths was generally similar to that which is shown in the aggregate number. The annual rate of mortality did not rise quite to the average; for the former was 199 in 10,000 of the population, the latter is 202. In the cold September quarter of 1860 the rate was 172.

The mortality in the country and small towns was 175, whereas that of the large towns was 219. The respective average rates are 172 and 230. Whence it appears that in an equal number of the population (10,000) there were 44 deaths more in towns than in country; but the health of the former was better this quarter, relatively to their own former experience, than that of the latter, for the mortality amongst the

rural population slightly exceeded its average.

The town and country rates of mortality in the summer of 1860 were respectively 184 and 157. That season differed from the summer which has just passed chiefly in this respect, that it was much colder, and consequently diarrhoea prevailed much less than it has recently done. In 10,000 persons the excess of deaths this year over those of 1860, was 35 in towns, and 18 in the country. Other causes besides diarrhea affect in various ways the results; but the facts are sufficient to show that this complaint rules with a more deadly effect in towns, "where houses thick and sewers annoy the air." It deserves to be noticed that the annual deaths from diarrhoea in London ranged from 452 to 841 in the years 1840-5; they suddenly mounted to 2152 in 1846; they continued high during the whole period 1847-59, which embraced two cholers. epidemics; they were 3335 in 1859, which is more than a sixth part of the deaths from diarrhosa that year in England. They fell to 1383 in When an efficient system of drainage has come into operation in London and the large towns, and other sanitary works have sweetened the air above and the earth beneath, the permanent reduction of diarrhoea will be, it may be hoped, among the good results that will be gained; but that improvement "at home," which is so much needed by the poor, increased comfort in their dwellings and order in their habits, better food and purer drink, will probably be still more effectual in abating that disease by which so much infant life is yearly destroyed.

Amongst public sanitary undertakings by which periodical outbreaks of diarrhea and other diseases are to be encountered, there is none of more hopeful character than the introduction into towns of water pure and ample. An eminent statesman, to whom municipal institutions are greatly indebted, has declared that the erection of public drinking fountains should engage the attention of municipalities and other representative bodies, which have the power of levying the local rates. It must be still more an object of concern to establish its circulation within the houses of all classes of the community. And if the purity of Loch Katrine cannot be attained, it is still possible by improved mechanical means to reduce the contrast, far too palpable as it exists at present, between much of the water supplied to towns and that of the model Highland

An increase of deaths in Strood (Kent) was due to dysentery and scarlatina; and the Registrar remarks that "in a district having a large marsh surface, there will always be some autumnal dysentery, especially

when the season is warm and dry, as this quarter was in a remarkable degree."

Diarrhea is reported as having been prevalent and fatal in Manchester, Salford, Liverpool, Sheffield, York, Yarmouth, Norwich, and many parts both of town and country. Of 291 deaths in the Deansgate sub-district of Manchester, 73 were caused by infantile diarrhea. Some observations on the subject by Mr. Leigh will be found in their place in the Registrars' Notes. Of 254 deaths in the sub-district of Regent-road, Salford, 61 were from diarrhea. In West Wymer, Norwich, the same complaint was fatal in 50 cases in a total number of 177 recorded; at Deritend (Aston) in Warwickshire in 59 cases out of 187.

Low typhoid fever is very prevalent at Steyning in Sussex, where in consequence of bad drainage it is believed to cling with greater tenacity. The total deaths in Brighton were 427 against 342 in the same quarter of 1860. Fever prevails in the more crowded parts of the town of Buckingham, where drainage and ventilation are stated to be very imperfect. At Worcester, where there has been a great deal of typhoid fever, almost every case has been accompanied by "pustular eruption or ulceration of the throat, which sometimes became almost diphtheritic." Typhus carried off a man, his three adult sons, and his grand-daughter, who occupied two houses at Snitterfield (Stratford-on-Avon). It was very prevalent, though not very fatal, at Yeadon in the West Riding of Yorkshire.

Of 29 deaths at Somersham (St. Ives) 9 were caused by diphtheria; and of 31 at Ixworth (Thingoe) in Suffolk there were also 9 (in Great Livermere parish) from the same disease. It was fatal in 7 cases in Holt, Norfolk. Five deaths, all in one family, occurred from it at Burnham in the same county; and in the neighbouring sub-district of Snettisham "a malignant form of sore throat" is very prevalent, of which more than 30 cases (6 fatal) occurred in the parish of Hunstanton. Diphtheria raised the mortality at Loddon and Diss. It was fatal in 6 cases at Ellesmere. It prevailed greatly at Leake in Leicestershire, and it caused 5 deaths out of 26 at Holt (Wrexham) in North Wales.

The registrar of the Dale-street sub-district, Liverpool, complains both of its moral and sanitary condition, and draws attention to the following comparison, which is sufficiently striking:—In his own sub-district, containing a population of 29,078 persons, there were 266 births and 236 deaths in the quarter. In the sub-district of West Derby, with a population of 52,740, there were 497 births and only 208 deaths. The registrar of the more favoured locality partly explains the cause of so great a difference; he writes:—"There have not been so few deaths (in West Derby) in any quarter since that ending June 30th, 1856, though the population is now from twelve to fourteen thousand more than at that period, which proves that the inhabitants are in an unusually healthy state, owing in a great degree to the great care taken by the authorities of Liverpool in cleansing the streets, sewers and courts." It may be inquired whether the same watchful and beneficent care is not extended by the Liverpool authorities to the Dale-street district, where it is stated that ashpits are an abounding nuisance. The authorities in charge of this locality will not plead the want of successful example as an excuse.

The report from Salisbury is as cheerful as that of West Derby. It runs as follows:—

"The deaths are much below the average, which can only be accounted for by reference to the sanitary measures that have been adopted within the last few years. The city is thoroughly drained, running streams in every street called canals are covered over, and a supply of better water is obtained. The beneficial effects of these measures are now beginning to be felt."

Fourth Quarter.—October, November, December, 1861.

The marriage-rate, which had been low in the preceding nine months of 1861, continued rather low in the last quarter of the year. The birth-rate was not high in the first quarter of the year, but it rose above the average in the spring, continued above it in summer, and slightly exceeded it in the fourth quarter. There was no great amount of fatal sickness; for the mortality was below the average in each quarter of the year 1861.

Marriages.—The number of persons married in the December quarter was 97,072; the total number in the year was 327,412. The marriagerate of the quarter was 1.906 against an average of 2.000; the marriage-

rate of the year was 1.628 against 1.693.

In London the marriages in the quarter were 7333; in the north-western counties (Cheshire and Lancashire), which contain a rather larger population than London, the number was 7087. While the metropolis maintained its marriages, as compared with those of the corresponding quarter of 1860, Lancashire reported a considerable decrease, for in the two corresponding quarters the numbers in that county were respectively. 6835 and 6078. It was stated in a Registrar's report from Lancashire,

Note.—The three months January, February, March, contain 90, in leap year 91 days; the three months April, May, Juna, # days; each of the last two quarters of the year, 92 days. For this inequality a correction has been made in the calculations, also far the difference between 365 and 365°25 days, and 366 and 365°25 days in leap year.

made at the end of this year, that "the demand for labour in the cotton "factories and the market generally had been fully a third below the "average." The midland counties and Yorkshire also exhibited a decrease in marriages.

To take a few towns for examples of decrease: In Manchester marriages declined from 1285 in the last quarter of 1860, to 1150 in that of 1861; in Ashton from 342 to 271; in Blackburn from 412 to 281; in Preston

from 355 to 254; in Stockport from 332 to 218; in Bradford from 575 to 483; in Sheffield from 601 to 470; in Nottingham from 252 to 208.

The marriages of all England declined, but in some places there was an increase. In the district of St. George Hanover-square they rose from 235 to 290; in Wakefield from 117 to 141; in Tynemouth from 146 to 181.

Births.—The total number of children born in the last three months of the year was 166,620. The fourth is that quarter in which births are usually the fewest. The birth-rate was 3.27 per cent., whilst the average for the quarter is 3.23. It was high in Lancashire, Durham, Northumberland, and Cumberland.

Increase of Population.—The natural increase of population is the excess of births over deaths. This excess as exhibited in the registers is 61,511 in 92 days, or about 669 daily.

In the quarter 16,559 emigrants sailed from ports in the United Kingdom at which there are Government emigration officers; and of these 8068 were of English origin. 1604 of the English people went to the United States; 5916 to the Australian Colonies. In the smaller emigration of the Scotch the preference for Australasia received a still more striking development, whilst the Irish divided themselves into forces, not very unequal, between the two destinations. By comparing the returns for the December quarters it appears that emigrants to the United States were about 52,000 in 1851; from that point the number fell by a great but not constant decrease; it was about 40,000 in 1853, little more than half that number in 1856, about 15,000 in 1860, and the exact number last quarter was 5698.

The total number of emigrants to all parts in 1861 was 91,770, of which more than half went to the United States. The Irish element

constituted considerably more than half of the emigration to the United States, but it suffered a great reduction towards the close of the year; for the Irish emigrants to that portion of the globe were about 37,000 in the year, but about a fifteenth part of that number in the December quarter.

In the total emigration of 1861 the proportion of unmarried adults to

the married was rather less than 3 to 1.

Prices, the Weather, and Pauperism.—The average price of consols was 93\frac{3}{6}; it had been 91\frac{6}{6} and 91\frac{3}{6} in the previous quarters of the year. Wheat was 59s. 3d. per quarter; it was dearer than in the same period of 1860, and dearer by 16s. than in that of 1859. The means of the highest and the lowest weekly prices of mutton have not varied in the last three December quarters. Beef of the inferior quality was dearer than in the corresponding quarter of 1860. The mean price of the best

potatoes was 120s. per ton.

Mr. Glaisher writes in his "Remarks on the Weather" that we must travel back to 1831 for an October so warm as the last, and then back to 1811 for a second example. At Greenwich the mean temperature of last October was 5° in excess of its average. A marked change took place on 1st November, and the weather was cold on almost every day till the 24th. The 18th of November was singularly cold; its temperature was below 32° the whole day, and the mean was as much as 15°·1 below the average of the day. Another great change followed on the 25th, and a warm period which began on that day continued till the 24th of December. The year closed with cold weather. The fall of rain in November (5°2 inches) was the greatest fall in that month for 45 years, with only one exception. The total fall in 1861 was 20°8 inches. At Truro in the same time it was 39°9 inches; at Lampeter 43°9 inches; at Stonyhurst 39°6 inches; at Allenheads 51°7 inches.

The returns of the Poor Law Board exhibit a heavy increase of paupers. The number relieved in door was 128,533, against an average in the previous two December quarters of 112,392; those who received out-door

relief were 716,096, against an average of 679,088.

State of the Public Health.—The total number of deaths registered in this quarter was 105,109; it was not so great as in the same quarter of 1859, but greater than in that of 1860. It will be seen in the Tables that the deaths as returned for this quarter, and distributed in the eleven divisions of England and Wales, are less numerous than they were in 1859 in all of these divisions, with the exception of the north-western and the northern. The excess in the latter division is unimportant; that in the north-western counties is considerable, and arises from a higher mortality in Lancashire. The population of Lancashire is less

than that of London by about 340,000, and lives on an area seventeen times as large, but the number of deaths which it returned this quarter was 16,700, while that in London was only 16,173. The deaths in Lancashire were about 2000 more than in either of the two previous December quarters. In Manchester they were in the three corresponding periods successively 1743, 1682, 2123. Amongst other places in the same county that discover an increase may be mentioned Liverpool and West Derby, Wigan, Leigh, Bolton, Chorlton, Salford, Blackburn, and Preston. There was a decrease in Rochdale.

The death-rate for England and Wales this quarter was 2.064 per cent. of the population, the average being 2.182. Within eleven December

quarters the maximum has been 2.4; the minimum 1.997.

The population that dwell in the larger towns suffered a death-rate of 2.3; that of country parishes and small towns a rate of 1.8. The difference may be stated thus:—If the mortality of this quarter prevailed for a year, a proportion of the persons who inhabit towns, equal to five in a thousand, would die, who would survive the close of the year if their lot had been cast amongst a rural population.

But relatively to the standard furnished by the experience of former years in each of the two classes, the urban population obtained, or, by the successful application of sanitary science, achieved, a greater reduction of the mortality than that which was obtained in the rural districts. In the former, from an average of 2.5 the rate was reduced to 2.3; in the

latter it fell from 1.0 to 1.8.

In this Quarter, fever under various designations, typhus, typhoid fever, low continued fever, and scarlatina, prevailed extensively, and in many parts of the country. In Sussex, Rotherfield, East Grinstead, Steyning, and Horsham suffered from typhus or typhoid fever. Of 53 deaths at Steyning (sub-district) nearly a fourth part was from the latter disease. A family at East Grinstead, who occupied a new house imperfectly drained, was attacked; seven inmates, the entire household, were ill; five died. At Alverstoke, in Hampshire, out of 122 deaths 10 were from typhoid fever. At Isleworth four women lay dead, all at the same time, from puerperal fever. At Colliers End in the parish of Standon, Hertfordshire, some drains are allowed to remain in a filthy condition, and there scarlatina broke out and raged fatally. Typhus prevailed in the same county at Lemsford, Ashwell, and Therfield. The two former places are in a bad sanitary state; and Therfield is unfortunate in the quality of its water. Scarlatina was fatal at Aylesbury. There was much typhus or typhoid fever at Higham Ferrers, Peterborough, Helpstone, and Peakirk, in Northamptonshire; supposed to have arisen from nuisance in the two latter places. There were 30 cases of it, 4 of which were fatal in Pidley,

in the Year 1861 for different Parallels of Latitude.

Huntingdonshire, where the villagers are obliged to drink unwholesome water "out of ponds or pits." It prevailed also at Sutton and Chatteris in Cambridgeshire; at Woolpit in Suffolk; at West Ham, the town of Chipping and its neighbourhood, in Essex, where it attacked eight persons who lived in one house; at West Flegg, Trowse Newton, South Walsham, Pulham Market, Wells, and Blakeney in Norfolk. An instance is recorded in which 7 deaths occurred from typhus in one cottage. The enclosure of a large salt marsh at Wells, bad drainage, and the neglected state of poor dwellings, are believed to have doubled the mortality in that sub-district. Scarlatina was very fatal at Salthouse, also in Norfolk, where the poor suffer from crowding, the want of ventilation and other elements of good condition. Typhus raged at Mere and Boyton in Wiltshire, and at Gunnislake, a village in Devonshire, which in many parts (says the Registrar) is "terribly overcrowded," while ventilation and drainage are very defective. The same disease or a mild form of it was more or less fatal at St. Clement (Truro), St. Just in Penwith (Penzance), and in Somersetshire in the sub-districts of Banwell and Keynsham. In the parish of Church Gresley, Staffordshire, where stricter attention to sanitary measures is required, continued fever has been fatal. Many deaths occurred, also, from fever in Darlaston (Walsall). Many families in the county have changed their abode in consequence of the state of the iron trade. Typhus had increased at Leicester; it prevailed at Nocton and in Misterton in Lincolnshire. The sanitary condition of certain parts in the district of Lincoln is stated to be "very bad." Typhus and continued fever prevailed in the district of Basford; the drainage at Ilkeston being defective. The lace trade was in a state of depression. There was fever in Belper and Hayfield in Derbyshire. The township of Bollington (Macclesfield) has been very unhealthy the whole year. There were 50 deaths in it this quarter, 22 of which were from typhus and scarlatina. Fever was chiefly fatal in houses where are cesspools or heaps of rubbish, or where the drainage is bad. Of 27 houses that form a street in Bollington only two or three escaped the infection. Typhoid fever prevailed in Weaverham (Northwich). Of 86 deaths in Over 43 were from scarlatina. Fever was very common in Woodchurch (Wirrall). Macclesfield has reaped the benefit of extensive improvements in a reduction of the mortality. The sub-district of Darwen (Blackburn) in Lancashire suffered from typhus, which was fatal in 41 cases. The same disease was very severe in Yeadon, Yorkshire, and "a great many persons were afflicted with it." The prevalence of typhoid fever in Slaithwaite (Huddersfield) induced the local authorities to have recourse to sanitary means for its suppression. At Meltham, in the same district, "the unhealthy state of the atmosphere" was supposed to be the cause of the disease. But the town of Halifax enjoyed excellent health, and

Approximated to the results of Robinson's Anemometer by reductions from Whewell's.

"almost uninterrupted employment"; it has on the whole good drainage, and an unbounded supply of pure water. An increase of births and a decrease of deaths were the results. Elland Edge, in the same district, was less fortunate, for both typhus and measles prevailed there. Bradford was healthy, its sanitary condition having been improved, provisions, with the exception of meat, being cheap, and the working classes generally employed. But fever in various forms was unusually fatal at Bramley, where the depression of trade has caused much suffering, and an imperfect sanitary condition has drawn the attention of the Town Council of Leeds. Typhus has been very fatal at Morley (Dewsbury), and scarlatina in Castleford (Pontefract), which township is in some parts without a proper system of drainage. The latter disease, in a very malignant form, has raised the mortality of Market Weighton (in the East Riding) and the The latter disease, in a very malignant form, has adjoining village of Goodmanham. The deaths in the parish of Coyton near Scarborough were numerous "from scarlatina and other infectious diseases," which the registrar believes to have arisen from bad drainage. "Pumps locked up," "piggeries and cowsheds" emptying themselves in the street, "a stench intolerable,"—these fill up a sketch which does not flatter, and, if it be true, ought not to offend. Typhoid fever has been prevalent in the villages of Beadlam and Nawton (Helmsley), which are ill-drained, and have bad water. Low fever prevailed at Marske (Guisborough). Scarlatina has been severely felt in many parts of Durham, Northumberland, and Cumberland. Typhoid fever prevailed in Middlesborough (Stockton); in part of the town, especially, that has been recently built. Blaydon, in the district of Gateshead, which is often infested with scarlatina, "is below the flood marks, and some of the houses have been filled to the ceiling of the lower rooms during the autumn." At Keswick, where the weather was wet, and sanitary arrangements "not quite complete," typhoid fever has been common, and in some cases fatal. The villagers of Pill (Milford) in Wales suffered, much from typhus; it was fatal in Brymbo, where, as well as in the town of Wrexham, it is stated that the conditions of health have been hitherto much neglected.

Dr. Acland, the Regius Professor of Medicine in Oxford, has favoured the Registrar General with the following observations on the fever in that city, and in the region extending over the Thames basin:—

"It must be admitted that the ground on which Worcester College [where two fatal cases of typhoid fever were registered] is situated is low, and not well drained; but the same may be said of a great part of the city. Our drainage has not yet been put on a systematic footing; there are still whole streets using cesspools; still the sewage is cast into the streams; still we have an inadequate outfall; still the periodic floods infiltrate the subsoil, fill cellars in the lower streets, and by that infiltration and filling mix the exudations from old cesspools with the surrounding mould.

"All this is well known here, and many improvements in details have been made; but the best minds are well aware that in this district a larger measure than mere local improvement is required to work a thorough cure, and they are therefore not eager to promote lesser plans,

which they know will prove ineffectual.

"The fact is the drainage of the whole Thames valley above Teddington Lock ought to be in the hands of a Government commission; there would then be some hope,

"1st. That the towns on its banks would be induced to adopt the best known system for disposing of their sewage:

"2d. That the upper Thames waters would be made as pure as possible, for the use of the metropolis:

"3d. That the waters would be so regulated as to be quickly let off when accumulating, and retained at a proper level when falling:

"4th. That the death-rates on the banks would be diminished.

"Drainage works have long been in progress in many parts of the upper Thames and its tributaries. Under the Act of last session these will probably be increased, but they have not been nor are likely to be on any large concerted plan, nor on any uniform method. Great opportunities have been lost of buying up mills, of regulating locks and dams, and of making use of railway operations for controlling the streams.

"This is greatly to be regretted, because it may be safely assumed that, were the river and the lands near it under sound management, not only would the death-rate of some districts be diminished, but the com-

mercial value of much meadow land be increased.

"The latter consideration you may no doubt leave to landowners and capitalists; the former deserves your serious attention. A more thorough inquiry into the sanitary condition of this whole upper Thames valley than has yet been made would be both valuable and interesting. In constant and most obliging intercourse with the members of my profession over a considerable area, I have gathered many facts concerning the health of towns and villages and districts along the banks of the upper Thames; they are often curious and perplexing. They could be tested,—and a most instructive inquiry it would be,—only by a systematic investigation of the course of the river and its tributaries.

"I am inclined to think on the whole that it would appear,

"1st. That the working health of whole districts, and especially of Oxford, would be improved by proper river management, and a general system of drainage:

"2d. That sometimes the flat parts, sometimes the slopes adjoining the

flats, and sometimes the heights are the most unhealthy:

"3d. That the soil modifies in a high degree the effects of the surface waters; a low place near the river, being on gravel, may be quite healthy, when a place further off, and higher, but on another soil, shall have continuous crops of fever:

"4th. That in considerable areas ague has been very prevalent in the memory of man, and is now unknown; low fever (mild typhoid)

having taken its place:

"5th. That in the spots last named further sanitary improvement would eradicate a great deal of the fever, and of the tubercular diathesis:

- "6th. That in estimating the condition of these localities we must always consider the habits, clothing, food, dwellings, and wages of the people, as well as the drainage and exhalations from the soil:
- "7th. That while no doubt the register of the deaths is a true test of the health of these regions, yet the physician sees, or thinks he sees, feeble power, tardy convalescence, distress and discomfort incal-culable, which are not fully expressed in the death-rate, and which would also be relieved as it (the death-rate) diminished.
- "The way to test these propositions would be to make a careful examination, in the main valley and its tributaries, of the villages and towns on all the alluvial levels, on the slopes, and on the heights; noting the nature of the soil geologically; and to compare on the spot your registration returns for certain periods with the local knowledge thus acquired. The results would often be quite different from what would be expected. It would not be a very difficult undertaking, with the help of your office, and of the union medical officers.

"The truth is we ought to have such knowledge for all England; but I now press this restricted inquiry on your attention for two reasons, first, because it is feasible, from its limited and distinct nature, and,

secondly, because it would tend to purify and regulate part of the water

supply of London.

"Why the Londoners do not rise up in arms against us provincials for remorselessly pouring our sewage down upon some of their water companies, is a standing marvel. We may now assume that the elements of disease are carried in water; through what distance we do not know. Ordinary prudence should therefore keep the upper rivers above great towns as pure as is practically feasible."

HEALTH OF LONDON IN 1861.

WHEN the Census was taken on April 8th, 1861, the population of London was 2,803,989. If the rate of increase, which prevailed in the decennial period 1851-61, continued to govern its progress, the population enumerated received an accession of 11,149 by the middle of 1861, and the total number became 2,815,138.

In the ten years that intervened between the last two censuses the amount of increase of the London population was equal to 121 daily. But its natural increase, viz., the excess of births over deaths, did not much exceed 72 daily; whence it follows that nearly fifty persons on an average arrived and settled each day in the metropolis over and above that unascertained number of settlers who only stepped into the places of persons who left it for parts in these islands beyond its bounds, or for

more distant regions of the globe.

Whether London is equal to the task of providing by new and improved arrangements for this constant accumulation of human beings within its limits still remains to be determined by experience. When a family increases in its narrow lodging, in circumstances of dirt and squalor, that increase which should be its blessing becomes its bane; and at last fever destroys what slow disease may have spared. And in a city or a state the growth of its population is not a strength to be trusted, but a weakness to be feared, if improvement in its physical and moral condition is not commensurate with the growing urgency of its wants.

Two distinct outbreaks of cholera, which made havoc in many families and struck terror into all, and the brief but fatal eruption of influenza in 1847, furnish the most remarkable passages in the sanitary history of the metropolis during the last twenty years; but they cannot justly be regarded as its worst features. Other diseases, more frequent in their recurrence and persistent in their character, and also more wasteful in their effects, mark the whole period. Heavy bills of mortality forced public attention; and in the course of these years important

measures for the improvement of the public health have been undertaken, and some proof that they have not been unfruitful has been obtained. Health officers have been appointed for the city of London, for Marylebone, and the other metropolitan districts. Inspectors of nuisances have acted in co-operation with them. Drainage works have been carried out, and are in progress. The water companies obtain their supply at higher positions in the river, and subject it to improved filtration. The markets are inspected, and attempts made, with partial success, to protect consumers against unsound meat and noxious, fraudulent compounds. Hospital accommodation is extended; and, what is of prime necessity, the working classes have probably become more awakened to the care of their own health,—to the importance of keeping their dwellings sweet and dry. This task, which is imposed on the people themselves, and can only be performed by them, it is the object of police regulations to render possible; and unless it is fulfilled, public works will comparatively little avail. Altogether there is abundant proof of that increased regard for human life that attends civilization; and though much remains to be accomplished, it is true, according to the proverb, that " a work begun is half done."

In the ten years 1840-9, the mean rate of mortality in London was 2.51 per cent.; in the subsequent decennium, 1850-9, it fell to 2.36 per cent. It is still more satisfactory to observe, that the rate of mortality in each of the last three years, 1859-61, has been less than the lower of the two rates that have just been mentioned. In 1860 the rate was 2.26; in 1861 it was 2.32. If the mortality of London were confined permanently within the limit represented by the mean rate of the last three years, the effect of that reduction in the population as it exists at present would be that more than 4000 persons would survive annually, whose lives would drop under the mean rate derived from the twenty years 1840-59. And if measures that have been already adopted are not relaxed, the amount of benefit will be increased, as the population that is the subject of it is increased. But a higher standard of health than any which the present tables show is possible, and, it may be hoped, will be attained.

Sixty-five thousand two hundred and fifty-one deaths were registered in London in 1861. In the March, June, September, and December quarters those thousands occurred in several proportions, which were nearly as follows:—19, 15, 15, and 16. The mean temperature of the air (49°.4) was higher than that of the preceding year (47°), and the mortality was also higher by about 3000 deaths. The two years were distinguished nosologically by a greater amount of fever in 1861, especially towards the

^{*} See note (*) on page 83.

end of it, by the much greater prevalence of diarrhea, and a general increase of disorders of the digestive organs. But last year the mortality from bronchitis and pneumonia was less.

There were 217 deaths from small-pox, a mortality which is less than that of the same disease in any of the last 13 years, except 1857. In 1852 and 1859 the annual deaths from it were more than 1100. Spitalfields, Mile End, Aldgate, Clapham, Deptford, and Poplar are localities where its presence was most felt. Thirty-four deaths occurred in the Small-pox

Hospital, Islington.

Scarlatina was fatal in 2381 cases; diphtheria in 674. Both diseases increased towards the end of the year. Croup and whooping-cough were very fatal; but the former, like scarlatina and diphtheria, increased towards the end of the year; the latter diminished. Quinsy also rose, and with other throat complaints was most fatal in the December quarter. Scarlatina appears to have visited all quarters of the metropolis, and with considerable impartiality. Somers Town suffered much; also the Waterloo-road neighbourhood. There were 23 deaths from it in Plumstead. Camden Town, West Hackney, and Rotherhithe are districts of nearly equal population: scarlatina was the cause of 43 deaths in the first, 18 in the second, only 4 in the third. In St. George Bloomsbury it caused 37 deaths; in Fulham, which is nearly equal to it, 32; in Hampstead, with a larger population, only 4. In St. George the Martyr, Holborn, besides 36 from scarlatina, there were 23 from diphtheria.

There were 1770 deaths from typhus. It did not appear in unusual force till the latter part of the year, and therefore the total mortality was not great. Indeed it was much less than that of many previous years. The districts of West London North, Poplar, and Greenwich may be mentioned among those which suffered most from typhus. The London Fever Hospital recorded 118 deaths, whilst the total number from scarlatina and typhus in the West sub-district of Islington, including those in

the hospital, was 152.

The most fatal zymotic disease in the year was whooping-cough (3548); next to it scarlatina with diphtheria; then diarrhea (2611). In respect to the last complaint the summer quarter was as usual the season of its activity.

It may be added that nearly one out of a thousand persons living died of diarrhea in St. Mary Paddington, Kensington Town, Hoxton, Stepney,

For the years 1845-59 the results are only approximative, having been reduced to Robinson's Anemometer from observations made with Whewell's.
† By Robinson's Anemometer, adopted in place of Whewell's, which was used formerly.

Mile End Old Town, Poplar, Newington, Rotherhithe, and Plumstead.

In many parts the ratio was higher.

There were 2296 deaths by violence in the year. This class of cases bears a rather larger proportion to the mortality from all causes than it did ten years ago. By comparing the three years, 1850-2, with the last three, 1859-61, it appears that while the total deaths increased in the proportion of 16 and 19, those by accident, suicide, and homicide increased in that of 16 and 21.

The number of persons last year who received fatal fractures and contusions was 752. Falls from scaffolds, and street accidents make their annual contributions to the list. When building operations are extended in all directions, and the stream of men and horses from the widening area pours through old channels into the centres of traffic, casualties of this description must increase faster than the population. The railway system extended, and reaching to the heart of the metropolis, will counteract this tendency. But an ædileship that will widen the streets, open new approaches, and prevent or quickly sweep from the streets and pavements the hideous shoals of mud and dirt that periodically cover them, will promote the public health and safety, and in an immeasurable degree the public comfort.

The number of deaths in 113 Public Institutions was 10,276, or nearly a sixth part of the whole. Of that number more than a half occurred in workhouses. Of 100 persons who shared the common fate of humanity, nine died in establishments provided by parochial rates; six in hospitals for the treatment of sick persons. In the workhouse of the most populous parish, namely Pancras, there were 487 deaths; in that of Marylebone, the third parish in respect of population, there were 450; while in the workhouse of Lambeth, which is a rather more populous district than

Marylebone, there were only 299.

GREAT BRITAIN.

With the assistance furnished by the returns of the Registrar General of Scotland, marriages, births, and deaths in Great Britain are known, and results are deduced from them.

The estimated population in the middle of 1861 was 23,181,790, of which 3,062,294 inhabited Scotland. The persons in that aggregate population, who married in the year, were 184,534; the children born alive 803,442; persons who died 497,401. The excess of births over deaths, or the natural gain of the population in a year, was 306,041.

The marriage-rate was considerably lower in Scotland than in England; the birth-rate was rather higher in the smaller kingdom; the death-rate was 2 034 per cent., and therefore appreciably lower than the English

rate (2.163).

The following are the results for Great Britain; persons married were 1.502 per cent. of the population; births 3.466; deaths 2.146.

Table XXVI.—Estimated Population, Marriages, Births, and Deaths in Great Britain, in the Year 1861.

	ABEA IN STATUTE ACRES.	Estimated POPULATION in the middle of the Year 1861.	Marriages,	PERSONS MARRIED.	Вівтня.	DRATES.
England and Wales -	37,324,883	20,119,496	168,706	\$27,412	696,406	485,114
Scotland	19,639,877	8,062,294*	20,828	41,656	107,086	62,287
GREAT BRITAIN -	56,964,280	23,181,790	184,534	869,068	803,442	497,401

^{*}The population of Scotland, as enumerated at the Centus of 1861, has been used for this Table.

The average area to one person is 2.46 acres in Great Britain; it is 1.86 in England; in the sparsely peopled northern Kingdom it is 6.41 acres.

Table XXVII.—Proportion per Cent. of Marriages, Births, and Deaths to the Population of Great Britain, in the Year 1861.

1860	1.639	2.908
1861	1.574	2:567

the deaths in it in 1861. The average strength was 122,536; the deaths were 3097.

It has been stated that the rate of mortality in Great Britain was 2°146 per cent. With an estimate of that proportion of the army abroad which belongs to Great Britain, the mortality of the whole population, inclusive of the army at home and abroad, was 2°147. In France the death rate was 2°308.

Both the marriage and the birth-rate were lower in France than they were in England, whilst the death-rate was higher. Persons married were 1.544 to a hundred of the population, whilst in England they were 1.628. Births were 2.688, against the English rate 3.461. Deaths 2.308, against 2.163.

The population of France estimated for 1861 is 36,752,565. The marriages were 283,642; the births were 987,830; the deaths 848,174. The excess of births over deaths was in France 139,656; in England 261,292 in a much smaller population.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

The Registrar General of Seamen has favoured me with a return, in which it appears that the number of deaths of Merchant Seamen at sea in

Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Seamen. This return does not include seamen dying ashore in foreign parts, whose wages and effects are delivered to the consults or officers of the hospitals to which such men are sent; accounts of their effects are sent direct to the Board of Trade.

The deaths of soldiers, marines, and invalided seamen from the Royal Navy were 33 in 1836, 59 in 1837, 136 in 1838, 136 in 1839, 136 in 1830, and 69 in 1861. The number is 709 in six years, which, if added to the 2570 above, makes 3279, the total number of deaths of British subjects at sea in 1836-61, exclusive of those of merchant seamen.

If a seaman dies on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel is not to return direct to the United Kingdom. But if a passeager dies on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred.

A column headed Flace of Birth was formerly contained in the schedule, for the purpose of distinguishing passengers as British subjects or Foreigners, but in many cases it was not filled up by masters, in consequence of their inability to obtain the information after the death had taken place. A column headed "Whether "supposed to be a British subject or Foreigner" might be attempted. British and Foreign seames are distinguished.

When a ship is lost with all persons on board, the owners return the number and names of the crew, but not of the passengers, to the Registrar-General of Seamen.

PROGRESS OF REGISTRATION.

There were 6133 searches in the registers at the Central Office during the year. At the termination of it the Registration Act had been in operation during a period of twenty-four years and a half; and the entire number of names entered in the registers, of persons who had been married, of those who had died, and of children that had been born, the accumulated product of those years, was 30,971,551.

The success of the working of the Registration Act, like that of any other measure, must depend, to an extent that cannot be over estimated, on the character and qualifications of the officers to whom it is entrusted; and primarily it must depend on that numerous body of functionaries whose sphere of duty is external to the central office, and who are appointed to act in their respective districts, as superintendent registrars, registrars of births and deaths, and registrars of marriages; besides whom may be mentioned secretaries of synagogues and registering officers of Quakers. Certain requisites, which the persons selected to hold those offices should possess, present themselves as the most obvious and important; respectability of character, intelligence, the ability to spell with correctness, a clear and legible handwriting. Under the English Act, the remuneration which the district officers receive is probably in almost all cases only subsidiary to other means of livelihood; and that measure of success which has attended the operation of the Act is in no small degree to be attributed to the freedom it permits in the selection of those officers. The result would have been materially different if the choice had been narrowed to the medical, legal, or any other profession. The greatest diversity of occupations is found among the registrars; some are solicitors, some surgeons, some chemists; others are relieving officers, clerks, schoolmasters, farmers, dissenting ministers, parish clerks, undertakers, land agents, surveyors, auctioneers, grocers, tailors, &c. &c. It will be found in some instances, and especially in country parts where

Norg.-The numbers registered in 1837 are for the Half Year ending December 31st.

population is thin, that there is difficulty in securing the services of properly qualified persons; and it is manifestly impolitic to increase the difficulty by clogging the choice of a candidate with conditions that are not essential to the right performance of the duty. In the Bill now before Parliament for registering births and deaths in Ireland it is proposed that the medical officers of dispensary districts should be the registrars. This provision is open to objection, on the grounds that have been now stated, and not less for other reasons that will suggest themselves on consideration. Undoubtedly there are medical men who act as registrars in England, and who perform the duty in the most satisfactory manner; the names of many might be mentioned; but it must be acknowledged, nevertheless, that the habits of a surgeon in good practice tend to disqualify him for the sedentary mechanical office of entering after careful inquiry, with measured movement, and in fine round hand, a number of particulars in the forms of a manuscript book. The "prescription-hand" is notoriously ill adapted to this purpose.

A letter by Dr. Farr on the causes of death in the year 1861 will be

found in the Appendix, to which I invite your attention.

I have the honour to be,

Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

The Wharfedale union or district (493 b) was formed, 4th June 1861, by the severance of parishes from the Otley district (493 a), and of the fownship of Horsforth from the Kirkstall sub-district of Hunslet (500).

The township of Horsforth (population 5981 in 1881) was pareferred from the Kirkstall sub-district of Hunslet (500) to the

^{**} The township of Lofthouse with Carlton (population 2038 in 1861) was transferred on 22d July 1861 from the Rothwell subdistrict of Hunsiet (500) to the Oulton sub-district of Wakefield (503).

†† Includes one widower who married a woman divorced.

X.-NORTHERN COUNTIES.

The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Pur Is Unions. As the principal adopted has been to place a District or Union which extends into more than one County with the County is not either the principal town or the greater part of the population ha located, the limits of the Registration Counties differ more or less has 6 boundaries of the Counties proper.

[†] Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1861-continued.

The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births. Deaths, and Marriages 1 and are generally identical with the Poor Law Unions of the same names. The Districts, 631 in number, are arranged according to their local position under the Registration Counties.

Note.—Wherever the minus sign is prediced to the number in the column headed "Excess of Rights over Deaths," it denotes the District, instead of exceeding the Deaths, were, in fact, less then the Deaths to the extent stated.

Note.—The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose.

The letter W denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; w indicates that a Workhouse belonging to another District or Union is included.

Wherever the union sign (~) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

The Excess of Deaths over Births in several of the Sub-districts of London is attributed to the unorthity in Hospitals.

For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 88-4.

ENGLAND .- SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 114 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a few persons, or diseases which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Where it is desired,

Causes of Death at different Periods of Life, in the Year 1861.

partial correction, however, can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as mumps, epistaxis, piles, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120-125.]

Note.—In calculating the average annual rate of mortality from all causes in London, a correction has been made by distributing the deaths in hospitals proportionally over every district.

Population 1861, Average Annual Rate of Mortality from All Causes in the Ten Years 1851-60, and Deaths from several Causes in the Year 1861, in the DISTRICTS of England—continued.

Note.—The aggregate result in these groups furnishes a sufficiently correct indication of the prevailing mortality. The statement of the mortality of any One Hospital is qualified by the fact that the mortality is not deduced from the division of the deaths by the average number of patients, but by the number on one particular day.

DEATHS at different Ages of Males registered in the 46 London Workhouses* during the Year 1861.

ETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in ENGLAND in	
1861, by WILLIAM FARR, Esq., M.D., F.R.S., D.C.L.	213_23

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in England, by William Farr, Esq., M.D., F.R.S.

YEAR 1861.

SIR,

I BEG to submit to you the following observations on the pre-

vailing diseases of the year 1861.

The mortality in that year, although it was below the average, was not so low as it was in the year preceding; and the increased prevalence of four diseases accounts for more than the whole of the difference.

Among the four prevailing diseases were typhus, including typhoid fever as well as relapsing fever, which medical practitioners distinguish, since these varieties were clearly defined by Dr. Jenner. The typhoid disease displays itself especially in the places which are also attacked by cholera, diarrhea, and dysentery, the three other reigning diseases of the year.

The summer was warmer than usual; and the excess of mortality was in that season. The districts of the towns also suffered in more than the average proportion; because the enteric diseases are not the direct result of heat, but of the various zymotic matters, which, where they exist, are rendered unusually active in the air, in the water, and in the blood, under high temperatures.

It is shown by the returns, that there has been an unusual prevalence of diarrhea, periodically passing into cholera or dysentery, ever since 1832; and in 1861 these diseases killed more than 20,000 persons. Fever, which is often propagated through the same channel, was fatal in 15,440

The practice of keeping the refuse of the sick and the healthy of successive generations in the cesspools alike of cottages and palaces every day grows more pernicious as the population becomes denser; for the water is defiled in wells, and even when the cesspools and drains are emptied into the Thames and rivers, it is pumped again into the houses only partially purified. The ova of worms and the seeds of various diseases are thus diffused among children; while great numbers of men and of women in the prime of life also suffer, and often die of the maladies which are the inevitable consequences of violations of natural laws.

The food of the people is taken from the land; and it appears to be a part of the economy of nature that to sustain fertility, the refuse should be restored, with the least possible delay to the land. The economic law is enforced by heavy penalties on the populations by which it is violated; but the penalty does not always fall on the offenders, and hence it is a case for the interference of the legislature. The existence of putrid dirt, or of any zymotic leaven, in towns and in the vicinity of dwellings, is a nuisance; and a legislative provision for its removal would be quite in conformity with the sound principles which are embodied in our common law.

I. ZYMOTIC DISEASES.

The remittent fevers of England have now subsided, and either attack few persons, or occur in a mild form; which, although it disables considerable numbers in the marshy districts, is rarely fatal. Thus 134 males and 120 females died of remittent fever; and 88 males, 61 females, died of ague and its complications.

The continued fevers destroyed the lives of 7660 males and of 7780 females in the year; or 15,440 persons in the aggregate. This, according to the estimate of Dr. Murchison, implies that about 154,400 persons were

attacked by fever in one or other of its three varieties; which are well established, but cannot yet be satisfactorily discriminated in the national returns, and are classed under the head of typhus.

The three forms of fever include pure typhus,—with blood spots on the skin (petechiæ),—which is exceedingly fatal, for 21 in 100 cases die in the London Fever Hospital. It is generated in crowded populations, and is

often diffused by infection. Second attacks are seldom seen.

Typhinia. The second form of continued fever is described as relapsing fever, or famine fever; as the patient, after getting well apparently about the seventh day, is subject to sudden relapse on the fourteenth day; and the fever is epidemic and infectious in times of scarcity and famine. The mortality does not exceed $2\frac{1}{2}$ per cent.; and it has been designated by the short name of typhinia. To one death there are about 40 cases.

Typhoid fever or typhia. The third form of fever is endemic, and is characterized by an eruption of rose spots on the skin, with affections of the glands of the ileum and mesentery. The disease is often protracted to the 30th day; and at the London Fever Hospital 19 cases in 100 terminated fatally. It attacks the young. Second attacks are rare. So frequently is it generated or communicated by night-soil, that Dr. Murchison has named it pythogenic fever; and Dr. W. Budd insists that the alvine dejections of patients should be destroyed by disinfecting agents.*

The infantile remittent fever of England has been shown by Dr. West and others to be modified typhia, with which it is classified. Typhia is fatal to children; and it is, next to consumption, still the disease most

fatal to men in the prime of life.

The mixing up of the three forms masks the peculiar endemic character of typhoid fever (typhia); but as it makes up a large proportion of the cases of death from continued fever, it is not difficult to point out, by means of the Table (pp. 160-171), some of the fever fields of England and Wales.

The mortality by fever was at the annual rate of 8 in 10,000; and for the sake of distinction, we may put down every district in which the mortality by the disease exceeded 8 in 10,000 as a fever field in the year. There an unusual number of men fell the victims of typhoid fever—typhia; while in other districts the deaths occurred in fewer numbers.

1770 persons died of fever in London; but this proportion (6 in 10,000) is below the average of the kingdom. Still the fever field of London covered Shoreditch, Whitechapel, Stepney, Mile End, Poplar, and Bermondsey. The Fever Hospital is in Islington, where the deaths from the disease in the Institution are registered. The patients are brought from all parts of London.

Guildford in Surrey was visited by the fever; 27 persons died. Dartford, Gravesend, and North Aylesford; Tenterden and West Ashford; Blean and Faversham; Thanet, including Margate and Ramsgate, as well as Dover, lost several lives by fever. Taking the whole of Kent, the mortality by fever in the county was somewhat below the average.

^{*} For full descriptions see the Treatise on the continued Fevers of Great Britain, by C. Murchison, M.D. This great systematic work gives the bibliography and synonymes, and all the prevailing doctrines of fevers, as well as the results of the author's own researches.

Battle, Hailsham, Ticehurst, Uckfield, and East Grinstead in Sussex, suffered from the endemic; in the Steyning District near Brighton, 31 persons died of fever, in Horsham 17.

The fever field extending over Portsea Island and Alverstoke was fatal; and the deaths amounted to 153, or to more than 1 in 1000. It is greatly to be regretted that the sanitary state of both Portsmouth and Gosport, the great seat of the naval and military power of the country, should still remain in the deplorable state that so many deaths imply. The Isle of Wight is in constant communication with Portsmouth; and was, unhappily, part of the fever field. Seventy persons died of fever in the Isle of Wight. Northwards the fever ascended the Southampton waters; and this seaport was another centre of the fever, which was, however, still more fatal in South Stoneham, and up the valley of the Itching in Winchester. Abingdon was another centre of the fever, which extended along the Thames valley, but was not so fatal in Windsor and Eton as in the Isle of Wight. Seven persons died of fever in the Windsor district.

I may perhaps be permitted to add here, that one of the seven was His Royal Highness the Prince Consort, who died on the fourteenth day of December, at the age of 42 years, after 21 days illness, of typhoid fever.

During his life he promoted measures for the improvement of the health of the people; and his death impresses on us with additional force the duty of investigating a disease which is fatal to thousands of all classes, and inflicts irreparable losses on the world.

Wycombe and other districts of the county of Buckingham; Bicester and several districts of Oxford; Royston and Walford; nearly all the districts of Northampton and Huntingdon; Bedford, Wisbeach, North Witchford, and Ely; all sustained heavy losses by fever. The whole of the South Midland Division, which sends its waters down to London, was infested by the fever to a much greater extent than London itself; and the waters from fever districts are not always free from the fever leaven.

In the Eastern Division the fever prevailed extensively, and of it 854 persons died, the mortality of the counties ranging from Suffolk to Essex and Norfolk, where it was highest. Rochford, Billericay, Tendring, Halsted, Braintree, and Dunmow were visited with some severity; so was Sudbury in Suffolk. In Norfolk,—Yarmouth, Erpingham, Forehoe, Depwade, and Walsingham and Freebridge Lynn, were centres of diffusion, and suffered severely.

A few districts, such as Mere and Sherborne in Wilts and Dorset, suffered; Honiton and St. Thomas, as well as Tavistock, in Devon, lost several lives by the fever; which was, however, especially fatal in Plymouth and the surrounding districts, precisely as at Portsmouth: so bad is the sanitary condition of all the seaport towns, which will in times of war undoubtedly affect unfavourably the efficiency of seamen. St. Germans, near the Plymouth waters, St. Austell, Truro, Falmouth, and Penzance, in Cornwall, complete the line of districts on the southern coast, which were in communication with each other by water, and were all visited severely by the fever. Bridgewater, Axbridge, and Clutton, Somerset, are among the fever districts.

The counties on the Severn suffered much less than the counties on the Thames and the southern coast; and Salop, in their centre, lost 4 in 10,000 inhabitants by the fever.

Staffordshire, and notably Walsall and Dudley, as well as the Worcester district, lost many lives by the fever: so did Leicester and Melton Mowbray; the districts of Lincoln; Basford and Nottingham; Derby, Belper, and Ashborne; Congleton and Northwich in Cheshire; Liverpool, Manchester, Wigan, Bolton, and the greater part of the districts of Lancashire, where the rate of mortality by fever on an average exceeded 9 in 10,000. Yorkshire experienced the same high mortality from the fever: the rate exceeding in some districts 10 in 10,000; as it did also in Durham.

Digitized by GOOGLE

The healthy districts of Northumberland, Cumberland, and Westmorland escaped with comparative impunity: Newcastle, Castle Ward, Tynemouth,

Table II.—Deaths registered from Pever in the Isle of Wight in the Year 1861.

Hexham, Morpeth, and Cockermouth in these counties being the principal

exceptions.

Wales and Monmouthshire have suffered extensively from fever; and the sanitary arrangements of the principality are not yet at all adapted to meet the wants of dense populations. At Abergavenny the people died by fever at the rate of 25 in 10,000; and the fever mortality was high in all the surrounding districts, except Chepstow. Great numbers died of fever at Merthyr Tydfil and Neath in Glamorganshire, and Swansea and Llanelly in Carmarthenshire, as well as in Pembroke and Haverfordwest. The districts on the southern coast of Wales suffered even much more than the districts of the southern coast of England. Aberystwith and some of the districts which are frequented in Wales by visitors also suffered from the prevailing fever.

The fever, in some of its forms, was fatal in every district of England and Wales, except three; but in some districts it was fatal to few, in

others to hundreds, of people.

The fevers of the year were more fatal than they were in the previous year; but not so fatal as they were in the four years, including the year 1851 of the Exhibition, and the three years following, when the fever mortality exceeded 10 in 10,000; or when one in 1000 persons on an average died of fever. (See Table IV.) The range of mortality in the twelve years ending in 1861 was from 6.63 to 10.41 in 10,000.

The average rate of mortality from fever in the ten years 1851-60 was, among males, 9.07 in 10,000; among females 9.09 in 10,000, at all ages. One in 24 deaths from all causes was by fever. The total deaths by fevers

in ten years were 172,458.

In the Table below the deaths are given at the different ages; and as there are ten attacks to one death, the deaths in ten years represent the attacks of fever in one year. But as the deaths are lowest in proportion to the attacks at the age of puberty, and as the rate of mortality increases with age, the liability to an attack of fever at each period of life is not represented by the deaths.

Diphtheria was recognized on its first appearance only by the most skilful medical practitioners; and it was often confounded with putrid sore throat or cynanche maligna, and scarlatina. Under these diseases 13,897 deaths were returned; including 9077 by scarlatina, 303 by cynanche maligna, and 4517 by diphtheria. The epidemic of diphtheria was at its height in 1859; and has since slowly subsided. But there is still a peculiar prevalence of sore throat, which is, perhaps, diphtheritic.

85 and upwards -	33,201	451

Diphtheria prevails at later ages than scarlatina; for one third only of those who died of scarlatina were five years of age and upwards, while one half of those who died of diphtheria were of that age. Still diphtheria is a disease from which the children and youth of the country are the greatest sufferers; for while in seven years 1553 adults died of the disease at the age of 25 and upwards, 28,216 died under that age. Scarlatina is fatal in London and in Lancashire; but it ravages the coal districts of the north of England, and is undoubtedly diffused and rendered fatal by causes which should be investigated and removed. Quinsy was fatal in a small number of cases. Croup was as fatal as diphtheria: it attacks chiefly boys and girls of one, two, and three years of age. The boys die in greatest numbers. Girls, upon the other hand, suffer most from whooping-cough, which in the present year was most fatal to children. Of it 12,309 children died; and of measles 9055. These two diseases affect the texture of the lungs, and of the breathing apparatus. London lost 3548 children by whooping-cough.

Small-pox exists now almost by sufferance; but owing to the neglect, or to the inefficient practice of vaccination, 1320 deaths by small-pox were registered; 217 in London, 12 in Gravesend, 19 in Dover, 22 in Windsor, 30 in Northampton, 14 in Daventry, 27 in Wellingborough, 14 in Peterborough, 48 in Norwich, 18 in Exeter, 42 in Plymouth where it is dangerous to seamen and emigrants, 32 in St. Austell, 57 in Truro, 13 in Cheltenham, 18 in Caistor, 54 in Chesterfield, 15 in Manchester, 19 in Bradford, 14 in Rotherham, 25 in Durham, 38 in Newcastle-upon-Tyne, and 31 in Tynemouth, 17 in Carlisle, and 19 in Aberystwith.

It is impossible to determine in these cases who is to blame in not procuring for the helpless children the protection which the legislature has provided against small-pox. The coroners, by holding a certain number of inquests, might ascertain how the matter really stands, and may prevent acts of negligence which in their consequences are as fatal as the ordinary offences of manslaughter.

A few deaths from cholera and dysentery occurred in nearly every county; and in London, Lancashire, and Yorkshire the number of cases was considerable.

Diarrhoa generally prevailed in the same districts as fever; and looking at the fatality of the disease at the advanced ages, it demands the careful study of pathologists, in connexion with typhoid fever (typhia) on one hand, and cholera and dysentery on the other.

Rheumatism destroys life by attacking the heart, the head, or other vital parts.

The deaths by all zymotic diseases amounted to 87,986; and they were 20 per cent., or one in five of the total deaths. The mortality by them was at the rate of 4.4 in 1000 living.

The miasmatic order, comprising the diseases to which I have been referring, caused nearly all the mortality (4.2). The enthetic order includes syphilis, to which the deaths of 785 males and 570 females are directly referred. 4 persons died of hydrophobia, and 6 of glanders. These diseases are propagated by the insertion of zymotic matter in the tissues of the skin.

Dictetic diseases are the result of the privation of food and drink, in their due proportions, either in infancy or later in life. Scurvy and purpura are now rarely fatal; only 207 males and 198 females died of these diseases. Alcoholism is slow poisoning by spirits, or by undue doses of fermented liquors; and to it the deaths of 524 males, 133 females are explicitly referred.

Digitized by Google

The parasitic diseases are less prevalent than they were formerly in England: 1055 deaths are ascribed to thrush; and 157 to worms. It is worthy of remark that girls suffer more than boys from worms; thus the deaths of 71 girls, and of only 41 boys under 5 years of age, were referred to worms, and in after life an equal disproportion prevails. The female tissues perhaps afford the most fruitful nidus for parasites.

Table VIII, Causes of Death registered in England in each of the Ten Years 1852-1861.

ا	les 9 comprising Violent Deet	1								,	

[†] Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population. I The number of persons executed in the several years will not necessarily correspond with those in the rame years of the "Criminal Returns," inasmuch as the executions recorded in each year in the latter are derived from the desiss of conviction, while the numbers in this Tables are classed under the years in which the deaths are registered. § The cases of angina membraneous which would now be put to diphtheria were fermerly classed under the same head as scarlatins, but were distinguished in the notes.

II.—CONSTITUTIONAL DISEASES.

84,987 persons died of the diseases in this class; namely, 16,233 of diathetic, and 68,754 of tubercular diseases.

Gout is a diathetic disease; only fatal when, like rheumatism, it fixes on one of the great seats of life. 247 deaths are referred to gout. Dropsy is the common consequence of heart disease, or Bright's disease of the kidneys (nephria); but it is, in the present state of medical knowledge,

[†] Up to the year 1857 cases of so called "debility" and "premature birth" were classed together; when the new classification was introduced "premature birth" was kept apart, and "debility" and "strophy" were thrown into one line. This accounts for the changes in the table numbers.

due to the rapid improvements in diagnosis; for the members of the profession, through the medical journals, not only acquire knowledge of all new discoveries, but learn to apply them practically.

^{*} Order 2, comprising Violent Deaths in Battle, is emitted, as inapplicable to the civil population.

Scrofula and tabes have apparently increased; hydrocephalus has diminished from the same causes. Phthisis (consumption) was fatal to 50,594 persons in 1852, and to 51,931 persons in 1861. It is now the most fatal disease in England, and deserves the most careful investigation.

The mortality by constitutional diseases was at the rate of 4.3 in 1000 living; of which 2.6 was by consumption: 20 in 100 deaths were by diseases of this class; and 12 of the 20 were by consumption.

III. LOCAL DISEASES.

The local diseases include the pure inflammations of the various systems; the direct results of inflammation; and functional disorders.

167,454 persons died of local diseases; or 39 in every 100 dying from all causes. The mortality by local diseases was at the rate of 8.4 in 1000 living.

Table X.—Causes of Death in England in the Year 1861, arranged in the order of Mortality.

		J	• • • • • • • • • • • • • • • • • • • •		1

The first order of the class comprises the diseases of the nervous system,—the brain and its membranes, the spinal marrow, the nerves of motion or sensation, the sympathetic system, and the organs of sense. The deaths by the diseases of this system amounted to 55,625; including 3426 by cephalitis (inflammation of the brain and its membranes), 8795 by apoplexy, 9812 by paralysis, both these diseases occurring most frequently at the advanced ages of life; 2464 by epilepsy, which occurs at all ages, but is most fatal after puberty. Softening of the brain and some other affections of the system are undistinguished. Neuralgia is semetimes fatal; 33 deaths were the results of ophthalmia, 47 of otitis, and 27 of tetanus not returned as traumatic. 20 of those dying by tetanus were males; 7 females. The deaths of 25,423 children (chiefly) are returned as caused by convulsions. Three deaths are ascribed to fright, two to grief, one to rage, thirty-nine to melancholy.

The heart, and the organs of circulation which distribute the blood through every other system, were the seats of 18,076 fatal diseases. These diseases have increased since 1852 from 12,517 to the above number; another evidence of the progress of diagnosis, rather than of the increase of heart disease. Angina pectoris killed 149 men and 74 women; syncope

75 men and 96 women; phlebitis 29 men and 34 women.

The respiratory organs were the seats of 64,310 fatal diseases; and the annual mortality by them was at the rate of 3.2 in 1000. Consumption has its chief seat in the lungs; and if this be also taken it makes the mortality 5.8 in 1000. More than 27 in 100 deaths are by diseases of the organs of breathing and by consumption. The most fatal diseases of the order are bronchitis and pneumonia. The number of deaths by pneumonia has not varied much in the last ten years; while the deaths from bronchitis, on the other hand, have fluctuated extensively, and increased in the ten years from 17,073 to 30,986. This affection of the air tubes is frequently rendered fatal by extreme cold; and influenza, fixing its chief seat in the same structures, is often confounded with pure inflammation of the mucous membrane of the bronchi. Bronchitis is particularly fatal to the old; pneumonia to the young and to boys. Thus the deaths of 5,884 boys under five years of age are referred to bronchitis; of 8802 to pneumonia. The girls are sufferers to a less extent from both these inflammations; while the reverse happens in whooping-cough.

Deaths under five years of age by-

		1	Bronchitis.	Pneumonia.	Whooping-cough.	Total.
Girls	•	•	5183	7304	6495 -	18,982
. Boys	•	-	5884	8802	5331 =	20,017

The deaths by diseases of the digestive organs are 20,327; and the mortality by them amounted to I in 1000 living. The diseases of the liver produce 7434 deaths, of the pancreas 18, of the spleen 86; and the other deaths are from diseases of the intestine and stomach. Exclusive of ascites, 809 deaths are referred to the stomach, 8466 to the intestines; the latter presenting a larger area.

The diseases of the other organs and systems present many curious examples of fatal disease in both sexes, as will be seen on referring to the general and supplementary Tables. 9116 deaths are referred to the four

orders, or 2 in every 100 deaths.

IV .- DEVELOPMENTAL DISEASES.

These diseases arise directly out of the incidents of formation, birth, growth, and decay; and may be all designated as developmental phenomena. Premature birth is often the result of disease of the fœtus; the malformations are only fatal when they interfere with important functions; teething, paramenia, and childbirth give rise to certain peculiar fatal affections, of which they are the causes. Atrophy and debility are met

with in the infant chiefly under one year of age; after the age of 75 they are treated as the natural symptoms of the decay of old age. 71,948 deaths are referred to this class.

V .- VIOLENT DEATHS.

The number of deaths by violence of various kinds is 14,985. This is the greatest number that has ever been registered in England; and the increase in the nine years is 1465, for the deaths from the same class of diseases were 13,520 in the year 1852.

In the year 11 executions by hanging were registered; 1347 persons put themselves to death by suicide; 320 persons, according to the finding of the coroners, were murdered or slaughtered by men; and 13,187 were killed by negligence or accidents of various kinds. 120 violent deaths

were not described so as to admit of being classed.

Of the deaths by accident or by negligence 5589 are cases of fracture or contusions, 2351 are deaths by drowning, 258 by poisoning, 1014 by

suffocation, 120 by gunshot wounds, and 41 by other wounds.

Burns and Scalds.—The deaths by burns are so numerous that it is desirable to examine them more in detail. In the year 3053 persons died of burns and scalds; of whom 1620 were males, 1433 were females. The burns and scalds are sometimes immediately fatal; at other times they produce extensive and superficial skin injuries, which are fatal after many weeks of sickness. A certain number of children are burnt by their clothes taking fire; women are burnt in the same way. Fires burn people to death in conflagrations; and in explosions of mines or of manufactories, the workpeople are liable to be burnt. In various ways the number of men, women, and children who die by fire in England is enormous. Burns have increased in recent years, and the time has assuredly come to endeavour to put a stop to these human sacrifices.

39,927 persons were burnt alive in England, or were scalded to death, in the fourteen years 1848-61. 1344 were infants under one year of age; 4500 were children of one and under two years of age; 4902 and 4875 were two and three years of age respectively; and in these two years of age, before the child has learnt to dread the fire, it incurs the greatest danger. The boys, being in nursery language most "mischievous," are, until they are four years of age, burnt in greater numbers than girls; but at that age and afterwards the clothes of boys are less combustible

than the clothes of girls, and fewer of them are burnt to death. 19,796 children under five years of age died of burns; 10,800 of their number were boys, 8996 were girls.

At the age of 5 and under 10, 2958 boys and 4982 girls were burnt or scalded* to death. At the age of 10 and under 15, children learn the danger of fire to some extent; but of the girls 1273, and of the boys 792, were burnt to death at that age. Subsequently men are exposed to fires and explosions, in mines and works; and from the age of 15 to 20 the young men died in greater numbers than the young girls; at the age of 20 to 25, the young men who were burnt to death amounted to 731, the young women to 328; at the age of 25 and under 45, the men are still more exposed, and 2079 were burnt or scalded to death, against 893 women of the same age; at 45 the men grow more cautious, or are less exposed, so their deaths by fire decline, and the difference is not considerable, but the male deaths preponderate; at 55 to 65 the deaths of females by burns are in excess; while at 65 and upwards the men are partially withdrawn from danger, but the old women's combustible dresses catch the flames in their state of feebleness, and 2122 of them were burnt to death in fourteen years.

The Druidical sacrifices, the fires of Moloch, the Inquisition, the fires of Smithfield, the burnings of witches in the middle ages, and the immolation of widows in India, naturally excite horror in the present age. They admit of no historical palliation. Still it is evident that the lives were offered up mistakenly with a view to the removal of evil, and that the sacrifices were sanctioned by the religion or superstition of the age and people. The deaths by burning in England are ascribed to Accidents; but they are none the less dreadful on that account, particularly when it is considered that the victims are often as unnecessarily exposed as moths to the flames in which they perish.

Note.—No correction has been made in this Table for increase of population, consequently the mortality is everstated. The Table shows the relative rates of mortality in the two series at thirteen different ages.

Of the 10,800 males dying of burns under 5 years of age, 688 were less than 1 year of age, 2834 were 1 year and under 2, 2793 were 2 years and under 3, 2839 were 3 years and under 4, 2170 were 4 years and under 5. Of the 8996 females dying under 5 years of age, 661 were less than 1 year of age, 1998 were 1 year and under 2, 2109 were 2 years and under 3, 2256 were 3 years and under 4, 2000 were 4 years and under 5.

^{*} For the sake of brevity, "burn" is often used alone to describe all the injuries by fire and intense heat.

A special inquiry into the circumstances of the accidents by fire and by scalding water might suggest means by which they might be effectually

prevented; in the meantime the following points deserve immediate attention:—

1. Open fires, lights, and kettles of hot water, should be surrounded by GOOD GUARDS. This precaution is of capital importance.

2. Children and young people, and old women, should be systematically

taught the danger of fire.

3. The dresses of young children and old women should be made as much as possible of worsted or wool; which will protect them against cold, as well as against fire.

4. The muslin dresses, and cotton and linen clothes, might very properly be starched with the chemical materials which are found by

experience to render them to a certain extent incombustible.

- 5. Private houses should all be provided on each floor of the sleeping apartments with the means of escape in the event of the lower apartments taking fire during the night. Especial provision to be made for women and children.
- 6. Fireworks, powder-works, and chemical manufactories require special precautions.

7. Persons falling asleep near the fire, or near lights, (a) in a state

of intoxication, or (b) in fits, are frequently burnt to death.

- 8. Young children drink scalding water out of the spout of the teakettle, or fall into scalding water. This happens often in the lower classes, when the mother is out at work, and the young children are left at home alone. The means of obviating this danger are evident.
- 9. Special arrangements are, it is scarcely necessary to add, required for preventing the explosions of mines or of steam engines.

Public Institutions.

The great majority of the people of England live in detached dwellings; and a certain number reside in barracks, asylums, workhouses, hospitals, lunatic asylums, and prisons, or in public institutions, as they have been called, of various kinds.

The mortality of the inmates of some of these institutions is for various reasons much above the average; so the inmates having been returned at the Census, it was thought right to pick out the principal institutions in which the mortality was likely to be so great as to affect the mortality of the sub-district in which the institution is situated.

The list has been compiled on this principle, and does not include a great number of institutions of various kinds. It includes all the principal hospitals and workhouses.

The Commissioners in Lunacy, the Inspectors of Prisons, and the Poor Law Commissioners publish in their annual reports accounts of the respective institutions which come under their cognizance. The statistics of the hospitals of the country are not given at all, or are not given upon a uniform plan. Miss Nightingale, who perceived all the importance of

		of IMMATES on 8th April 1861.	Persons.	Males.	Females.	MORTALITY per Cent.	
	In 858 Public Institutions -	154,602	82,487	19,187	18,800	20.88	
ENGLAND	" 660 Workhouses – – " 106 Hospitals – – " 57 Lunatic Asylums –	119,984 12,709 21,909	22,785 7,237 2,425	12,822 4,960 1,365	9,963 9,277 1,080	18:99 56:87 11:07	

this information, suggested that the hospital statistics should be collected in forms, of which the members of the Statistical Congress in London approved.* And if the hospital boards carry out the plan, they will place the hospital statistics on a level with those of the other institutions of the country.

The number of institutions in the Table XIV. is 853, which held 154,602 inmates on the day of the Census, exclusive of the officers and servants. 32,437 inmates died in the year; and assuming that the average is represented by the enumerated population, the mortality was at the rate of 20.08 per cent, or 210 per 1000; while the mortality of the population of all England was at the rate of 22 in 1000, or 2.163 per cent.

The mortality in these institutions was ten times as high as the mortality in the population generally.

The annual rate of mortality in the lunatic asylums was at the rate of \$1 per cent., in the workhouses 19 per cent., and in the hospitals 57 per cent.

With respect to hospitals then, while the annual mortality of the general population was 2.16 per cent., the mortality of their inmates was at the rate of 56.87 per cent., or 26 times as high. The inmates of hospitals are, it is scarcely necessary to say, all suffering from diseases which tend generally to increase the risk of death.

The hospitals are filled by a succession of inmates, who remain for a time varying from a day to a month or a year, and the mortality is often given as so many deaths per cent. on the cases treated. The mean term of treatment varies in different hospitals; in many it averages 36.5 days, or the tenth part of a year. Assuming that term of treatment to be applicable, the mortality of the cases in these hospitals was 5.687 per cent. in 36.5 days; or the hospitals to every 100 beds occupied had nearly 57 deaths annually.

Hospitals enable the charity of the country to supply the sick with skilful medical advice upon the cheapest terms, and this has led to the establishment of the institution upon the voluntary principle in every county. An eminent physician or a surgeon can visit his patients in a short time as they lie in the same or in contiguous wards; and he often consents to attend them without any fee or salary. The collection of the sick under one roof conduces also to economy in the nursing department, in the kitchen as well as domestic service, and in the pharmacy, as the drugs can be purchased and dispensed at a cheap rate. A resident medical officer can attend to all the urgent cases.

^{*} English Programme of International Congress, pp. 63-5. See also Report of the Proceedings.

The cost of the building is generally so great as to make the lodging

much dearer than the best cottage accommodation.

One great evil has often counterbalanced all the advantages. The collection of a number of persons, exceeding those of an ordinary family, under one roof, has hitherto always had a tendency to increase the dangers of disease; for several diseases are, like fire and ferments, diffusible. The danger is increased when all the inmates are sick, for their breath and excretions spread through the wards. The dangers too are likely to increase in a faster ratio than the numbers, and the patients are less likely to recover health in the sickly atmosphere of a large building in a city than in pure country air.

These institutions were accordingly at one time infested by hospital gangrene, and by erysipelas; the lying-in hospitals were depopulated by fever (metria); infants perished by hundreds in the Foundling Hospitals; and even in the present day patients often die of hospital pyzmia, so frus-

trating the hopes of the skilful surgeon.

It must be stated that nothing can scarcely be worse than the ventilation

and all the arrangements of the old hospitals.

The classes of cases which are admitted into particular hospitals, and the reasons for which patients are discharged, differ largely, so that the investigation of the effects of hospital air, and of treatment in the various establishments, requires great care and skill. It is so important, however, that it should be undertaken for the sake of the sick, and for the sake of medical science.

A careful comparison of the duration and of the rate of mortality of certain well-defined diseases in hospitals and in private practice would

settle the question.

In the meantime it is evident from the Tables (p. 205 and p. 230) that the mortality of the sick who are treated in the large general hospitals of large towns is twice as great as the mortality of the sick who are treated in small hospitals in small towns.

It remains to be seen whether the mortality in small hospitals is not twice as great as the mortality of the same diseases in patients who are

treated in clean cottages.

Should this turn out to be the case, the means of realizing the advantages of the *hospital system*, without its disadvantages, will then be sought and probably found, as the problem is not insoluble.

I have the honour to be,

Your faithful servant,

W. FARR.

To
The Registrar-General.

[The following Index furnishes a reference to the Number of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and not under A, as Ashford, East.]
